

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CONTENTS.

REPORT :—	PAGES
GENERAL REVIEW of FACTS for the Year 1871	v
MORTALITY per cent. of MALES and FEMALES, 1838-54 and 1838-71	v-vi
MEAN LIFETIME of the ENGLISH PEOPLE; Remarks on the ENGLISH LIFE TABLE	vi
SANITARY state of the Country	vii
INCREASE of POPULATION, 1861-71, and INFLUENCE of EMIGRATION	vii-viii
METEOROLOGY at GREENWICH, 1871; PRICES of WHEAT, MEAT and POTATOES; and PAUPERISM in 1871	viii-ix
MARRIAGES in 1871. Celebrated according and <i>not</i> according to the Rites of the Established Church; Conditions of Persons married	x-xi
Ages of Persons married; Marriages of Minors; Signatures of Marriage Registers; Educational condition of different Counties, as shown by the Signatures of Marriage Registers; Buildings registered for the Solemnization of Marriages; Certified Places of Worship; Designations of Religious Bodies	xi-xv
BIRTHS in 1871. Number registered; Sex; Children born <i>in</i> and <i>out</i> of Wedlock, and Proportions of Illegitimate Births in various Counties; Seasons	xv-xvii
DEATHS in 1871. Excess of Births over Deaths; Death-rate	xvii
Sex; Age; Mortality of Males and Females at various Ages; Deaths of reputed Centenarians and Number of Centenarians said to be living at the time of the Census, 1871	xvii-xix
Seasons; Locality; Death rate in Urban and Rural Districts; Deaths in Public Institutions	xix-xx
PROGRESS of REGISTRATION. Aggregate Number of NAMES on the REGISTERS, Particulars as to the Alphabetical Index to the Names, LIST of REGISTERS and RECORDS in the Custody of the REGISTRAR GENERAL, and NUMBER of SEARCHES for Registers and of CERTIFICATES granted at the CENTRAL OFFICE	xx-xxii
UNITED KINGDOM. Population, Marriage, Birth, and Death Rates	xxiii-xxiv
THE ARMY. STRENGTH and MORTALITY of the ARMY at HOME and ABROAD	xxiv
BIRTHS and DEATHS of BRITISH SUBJECTS at SEA; MARINE REGISTER BOOK; MORTALITY from DISEASES and INJURIES in the MERCHANT SERVICE compared with that in the ROYAL NAVY	xxiv-xxv
WILLS. Index of Probates and Administrations kept at the General Register Office; Numbers and Values of Probates and Administrations in 1871	xxv-xxvi
FOREIGN STATES. Population, Marriage, Birth, and Death Rates in PRUSSIA	xxvi
AMENDMENT OF THE REGISTRATION ACTS	xxvi-xxvii
SUMMARY of the QUARTERLY REPORTS, 1871	xxviii-xlvi
HEALTH of LONDON and of other large Cities in 1871.	xlvi-lv
REMARKS on the METEOROLOGY of 1871; by James Glaisher, Esq., F.R.S.	lvi-lvii
PRELIMINARY TABLES	lx-cxvi
 ABSTRACTS :—	
MARRIAGES Registered in England in each of the Registration Divisions, Counties, and Districts in 1871; distinguishing those according and those <i>not</i> according to the Rites of the Established Church; in each quarter of the year; and distinguishing also Persons married according to their conjugal Condition, Minority, and Signature of the Register by marks	2-25
AGES of 270,028 Persons married in 1871, distinguishing those of Bachelors, Spinsters, Widowers, Widows	26-28

ABSTRACTS— <i>continued.</i>	PAGES
MARRIAGES, BIRTHS, and DEATHS Registered, and Excess of Births over Deaths, in each of the Divisions, Counties, and Districts in 1871; also BIRTHS and DEATHS and EXCESS OF BIRTHS over DEATHS in each of the Sub-districts of England; distinguishing the Sexes and Illegitimate Births throughout	30-84
BIRTHS Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters of 1871	86-89
BIRTHS of Children born out of Wedlock Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters of 1871	90-93
DEATHS Registered in each of the Four Quarters of 1871 (distinguishing Males and Females), in DIVISIONS and COUNTIES	94-97
DEATHS in Public Institutions in 1871, and Special Inmates enumerated therein at the Census, 1871	99-117
DEATHS of Males and Females at different AGES Registered in 1871 in DIVISIONS, COUNTIES, and DISTRICTS	120-141
CAUSES OF DEATH of Males and Females in ENGLAND, at different Periods of Life, in 1871	144-149
SUPPLEMENTARY TABLE OF CAUSES OF DEATH of Males and Females, in England at different Periods of Life, in 1871	150-153
CAUSES OF DEATH of Males and Females in LONDON, at different Periods of Life, in 1871	154-159
CAUSES OF DEATH of Males and Females in ENGLAND, and in each of the DIVISIONS and COUNTIES, in 1871	160-183
DEATHS from SEVERAL ZYMOTIC and OTHER CAUSES in 1871, in the DIVISIONS, COUNTIES, and DISTRICTS OF ENGLAND	184-195
VIOLENT DEATHS in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES	196-205
DEATHS returned as having occurred from SUICIDE in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES	206-209
DEATHS returned as having occurred from MURDER and INFANTICIDE in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES	210-212
DEATHS returned as having occurred from MANSLAUGHTER in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES	213-215

R E P O R T

TO

The Right Honourable JAMES STANSFELD, M.P., President of the
Local Government Board, &c., &c.

*General Register Office, Somerset House,
26th May 1873.*

SIR,

I HAVE the honour to submit to you my Report on the Registration of Marriages, Births, and Deaths for the year 1871.

The general results are more satisfactory than those of the year preceding. The marriages increased; and this implies that the young marriageable people of the country were prosperous. The births exceeded, the deaths were fewer than, those of the preceding year. There is only a slight decrease in the number of the men and women who sign the marriage register with marks, through inability to write their names at all, or at least legibly. There is a steady increase of marriages at the Superintendent Registrars' offices; the numbers were ninefold those in 1841. At the Established Church the marriages by licence have steadily decreased since 1865, while the marriages after banns have increased nearly to the same extent. The Roman Catholic marriages attained their highest numbers in 1866, declined during 1867-8-9, and have since slightly increased.

The most important deductions in my Report are drawn from a comparison of the registered facts with the population enumerated; and having now determined by the analysis of the Census returns not only the numbers living, but their ages, I am able to show the mortality of persons of both sexes at 12 different groups of ages for each of the 34 years 1838-1871. This is one of the most important series of facts relating to the life of a nation ever published; and it is worthy of remark that the mortality at the several ages for the 34 years differs little from the mortality of the 17 years, 1838-54. The mortality of males at all ages was 2·33 per cent. in 1838-54, and 2·33 per cent. in 1838-71; of females for the same periods, 2·16 and 2·15.

Annual Mortality PER CENT. of Males and Females in England and Wales.

AGES.	MALES.		FEMALES.		AGES.
	1838-54. (17 Years.)	1838-71. (34 Years.)	1838-54. (17 Years.)	1838-71. (34 Years.)	
ALL AGES	2·33	2·33	2·17	2·15	ALL AGES.

45—	1·85	1·85	1·59	1·56	45—
55—	3·18	3·20	2·82	2·80	55—
65—	6·69	6·71	6·00	5·89	65—
75—	14·76	14·71	13·44	13·43	75—
85—	30·14	30·55	27·92	27·95	85—
95 & upwards	44·03	44·11	43·22	43·04	95 & upwards.

Notes.—The Table may be read thus:—Of males of the age 25 and under 35 the rate of mortality per cent. was 1·00 in 17 years 1838-54; and ·99 in 34 years 1838-71, and so for other ages. The rates of mortality for 1838-54 are taken from the English Life Table, pp. xviii-xx; the rates for 1838-71 are the arithmetical means of the several rates for each of the 34 years, as shown in Tables 21-4, pp. lxxx-iii.

The coincidence between the rates of mortality at the ages when insurance is effected are equally remarkable. This is a decisive proof of the solid foundation of the English Life Table, which was calculated on the population living at two censuses, and on 6,470,720 deaths; for the rates are in complete accord with the rates deduced from the living at four censuses, and from 14,330,919 deaths, distinguishing the numbers living at 12 ages into which human life is divided in our tables, science being no longer contented with the seven ages of the old times.

The mean lifetime of the English people is by the table 40·86 years. That is the average number of years children born in England live.

It is gratifying to me at the end of 34 years to be able to say that one of the objects for which registration was established has been accomplished, and that the expectations held out in the following passage of the first Report from this office have been realised:—

“The recommendation of the Report” [of the Select Committee of the House of Commons on Friendly Societies in 1827, pointing out the insufficiency of the data hitherto collected, and the contradictory nature of the several Life Tables founded on them], “that measures be adopted for making ‘an accurate and extensive collection of facts,’ whereby may be facilitated ‘the solution of all questions depending upon the duration ‘of human life,’ is at length carried into effect; ample materials, thus conducing to ameliorate the condition of the working classes, are now afforded in the certified copies of registers deposited in the General Register Office, and each year’s accumulation will increase the value of such records, by augmenting the number of facts upon which calculation may be brought to bear.”*

The National Table is, it will be seen, a safe basis for the insurance of lives, as it includes all the population; and in the degree that persons living in unfavourable conditions, or labouring under disease are excluded, will be the proportion of profits dependent on the mortality.

* First Report of Registrar General for year ending 30th June 1838, p. 16.

The returns will enable us to follow any improvements in the state of the public health. Hitherto, the sanitary works of the country have been partial, and have been confined to places where the local authorities have displayed extraordinary energy ; in some places, such as Manchester, Salford, and Glasgow, the water supply is good, but other grave defects counteract its results ; in other places, as in South London, the water supply and the drainage have been greatly improved with the best effects ; in other districts the main drainage has been carried out effectually, but the subsidiary drains and the house drains are imperfect : and the population outside drained towns is increasing rapidly without a system of sewerage, and often with a bad water supply ; dwelling houses are still crowded ; the state of the small towns, the villages, the farmyards, and of many of the cottages remains much as it was ; and whole regions of great counties are in 1871 in a condition as unsatisfactory as they were in 1838.

What was wanted was administrative machinery, which will now be supplied by the new Sanitary Act to the whole country ; and I shall watch with interest, and endeavour to record with impartiality, the results of its operation.

Increase of Population.—The finally revised results of the eighth decennial Census show that on the 3rd April 1871 the total population of England and Wales was 22,712,266, having increased by 2,646,042 persons, or at the rate of 13·19 per cent. since the Census of 1861. This is the largest decennial increase, relatively as well as actually, that has taken place since 1831–41 ; and some, at least, of the causes which have led to this arrest of the tendency of the population to increase at the decreasing rate observed from 1811 to 1861 will no doubt be elucidated when the analysis of the conditions, occupations, and birth-places of the people is completed. But the effect of a particular cause or set of causes in augmenting or diminishing the rate of increase between any periods can at the utmost be traced approximatively so long as the marriage, birth, and death registers, an obviously defective record of emigration, an entire absence of knowledge respecting immigration, and a Census taken once only in every ten years are the sole available guides. The interest of the public at large in statistical inquiry is as yet undeveloped sufficiently to justify an attempt to establish a Population Register,* or a record of the migration of every person going into or coming from Scotland, Ireland, or elsewhere beyond seas ; and it is of little use to speculate upon the nearness or remoteness of the probability of obtaining statistics complete enough to demonstrate the part played by each of the many factors concerned in producing a growth or decline of the population.

Regard being had to disturbing elements, it is apparent as a broad general deduction from the facts that the population of England and Wales at the Census of 1871 was greater by 590,186 persons than it would have been had the increase between 1861 and 1871 been dependent solely upon the balance between the natural growth or excess of births over deaths and the recorded emigration. During the 10 years the births exceeded the deaths by 2,705,598, from which, deducting

* Population Registers are kept in Sweden, Belgium, and Holland. By a decree of His Majesty the King of Italy, dated 4th April 1873, a Register of the fixed population is to be established in that country : it is to consist of three parts, one relating to houses, one to families, and one to individuals. For each person the register is to show the name, surname, and sex ; the names of his parents ; the place and date of his birth ; his civil condition, whether single, married, or widower, and if married the name of his wife, ulterior changes of condition being duly posted up ; his rank, profession, or occupation ; his residence ; his declared civil domicile ; and a reference to the folio relating to families under which he will be found inscribed.

649,742 persons of English origin reported to the Emigration Commissioners as having sailed from this country within the decennium, there is a residue of 2,055,856 which would have approximatively represented the difference between the enumerated population in 1861 and 1871 supposing there had been no immigration. On an average of the 10 years the annual excess of births was 270,560, the annual number of emigrants, 64,974; and to account for the actual population discovered in 1871 it is obvious that the influx of Scotchmen, Irishmen, or foreigners, or of Englishmen returned to their native land, must have averaged about 59,019 per annum.

For statistical purposes, the population is estimated to the middle of the year on the basis of the rate of increase ruling between the preceding Census periods; in this way, the 22,712,266 persons enumerated on 3rd April 1871 are estimated to have increased to 22,782,812 by the middle of the year.

It is satisfactory to know that the estimates of population on which the rates of marriage, birth, and death in all England have been calculated since 1861 for my Reports have been proved by the enumeration of 1871 to have approximated so nearly to the truth that at the end of 10 years the difference between the actual and estimated population amounted to less than 500,000, which is equivalent only to a difference of 0.48 per 1,000 in the rate of mortality for 1871 calculated on the true numbers.

Meteorology.—The principal meteorological features of 1871, as described by Mr. Glaisher, were the unusually warm temperatures during February and March, the cold inclement weather during May and June, the extremely low temperatures recorded during the early portion of December, and the scarcity of rain during the last quarter of the year. The mean temperature of the air at the Royal Observatory, Greenwich, was 48°.7, exactly the same as in 1870, but nearly one degree below the average of 23 years. The rainfall amounted to 22.3 inches, or nearly 4 inches more than in 1870, but 1.6 inch less than the average. Mr. Glaisher remarks that although the meteorological values naturally varied considerably in the different localities whence returns are received, “so far as concerns the excess or deficiency above or below the average, the observations at the Royal Observatory may be taken as generally applicable to the whole country.” (See pp. lvi-lvii and xciv-xcvii.)

Prices.—I have frequently remarked on the intimate relation in which the prices of the principal articles of food stand to the health and well-being of the population, as evidenced in the returns of births, deaths, and marriages. It has been shown in my Reports that the rate of marriage among the lower classes is to a large extent influenced by the price of wheat; the marriages, by a natural law, determine the birth-rate, which in its turn becomes one of the factors that in combination determine the death-rate; and thus the sequence of events by which the life of communities is sustained, completes itself.

The fluctuations in the prices of wheat, meat, and potatoes during each of the 20 years, 1852-71, are shown in Table 30 (p. lxxxviii). Derived from authentic sources as matters of fact, the results are unquestionable, whatever difference of opinion may arise as to the inferences deducible from them. Thus in the year 1852, when as yet the long European peace was unbroken, the average price of wheat per quarter was 40s. 10d.; the average price per pound of beef by the carcass was 4½d., of mutton 4½d. In the succeeding five years, 1853-7, covering the period of the Russian War and the Indian Mutiny, wheat averaged 65s. 1d. the quarter, beef 5½d. per pound, mutton 5½d. per pound. During the three years 1858-60 the

Chinese and New Zealand Wars were in progress, and the price of wheat was 47*s.* 1*d.* per quarter, of beef 5*½d.*, and of mutton 5*½d.* per pound. Then followed the American Civil War and the Lancashire Cotton Famine, 1861-4, when wheat was 48*s.* 11*d.* per quarter, beef 5*½d.* per pound, and mutton 6*d.* From 1865-7 the Cattle Plague ravaged the herds of Great Britain, and a great crisis in commercial affairs occurred; wheat in this period averaged 52*s.* per quarter, beef 5*½d.* per pound, and mutton 6*½d.* In the four years 1868-71 wheat was 53*s.* 11*d.* per quarter, beef 6*½d.* per pound, and mutton 6*½d.* Comparing the averages of these several periods, it appears that as between the initial year 1852 and the final period 1868-71, the price of beef has increased 47 per cent., and of mutton 30 per cent.; of this increase two thirds arose in the Russian War period, beef having increased since 1853-7 by about 13 per cent., and mutton by 9 per cent. only. A rise of 9 per cent. in the prices of both beef and mutton occurred in the Cattle Plague period, since which time beef has very slightly risen in price, while mutton has become cheaper.

The quantity of dead meat imported into Great Britain from foreign countries and British possessions abroad increased from 495,253 cwts. in 1859 to 1,088,890 cwts. in 1871, or 300 per cent.; preserved Australian meat began to be largely imported in 1867, and amounted in 1871 to about one eighth of the total importation of dead meat.

The Report of the Veterinary Department for the year 1872, lately issued, contains much interesting information about the meat supply of this country. From this Report I gather that 18,022,973 cwts. of meat were consumed in Great Britain during the year 1870, yielding an average consumption of 78 lbs. per head of the whole population; and that as regards beef an increase in the price of late years has not been confined to Great Britain, but has taken place in continental countries also.

It is to be regretted that no data exist, at least within my knowledge, for determining in a sufficiently satisfactory manner to what extent the general rise in the price of meat is caused by its increased use amongst the industrial classes in this country. Individual observation goes to show that the daily food of the average artisan or mechanic consists much more largely of flesh meat than used to be the case, but how far this affects the price, whether in greater or less degree than an increased cost in the production of the 67 per cent. of the total supply which is home grown, is but at best conjectural. There can be little doubt that the general rise of prices is consequent upon a depreciation in the value of money.

Pauperism.—The average weekly number of paupers relieved during the year 1871 was 143,605 in-door, and 803,797 out-door, being a diminution on the numbers for 1870 of 5842 in-door, and 23,310 out-door. In the year 1852 the paupers (in and out door) relieved constituted 5 per cent. of the whole population; in the four years 1868-71 the proportion was 4·7 per cent. On the other hand, the cost of poor relief increased from 5*s.* 4*¼d.* per head of population in 1852 to 7*s.* in the last four years.

MARRIAGES.

The number of persons married during the year was 380,224, or 16,914 more than in the previous year, and 26,284 more than in 1869. In the 34 years 1838-71 the mean annual ratio of persons married was 16·5 to every 1000 persons living: in 1871 the ratio was 16·7, being higher than in either of the four preceding years, but less by ·6 per 1000 than the mean annual ratio in the four years 1863-66. Some parts of the country did not participate in the increased marriage-rate of 1871; in the parts

of the counties of Surrey and Kent outside the Metropolitan limits, in Berkshire, Essex, Dorset, Devon, Somerset, South Wales, and North Wales, the rate was virtually the same as in 1870; in Oxfordshire, Cambridgeshire, Herefordshire, Salop, Northumberland, and Westmorland, there was a falling-off in the rate. The most marked increase occurred in the counties of Cumberland, Hertford, Nottingham, Warwick, Huntingdon, Bedford, Derby, and Worcester.

Forms of Marriage.—It is interesting to look back over the returns for what has now become a long series of years, and note the changes that have taken place in the rites or forms adopted for the legal ratification of the marriage contract. Thus in the five years 1841-45 nearly 92 per cent. of all the marriages registered in England were solemnized according to the rites of the Established Church; in the quinquennium 1866-70 the proportion was 77 per cent., and in the year 1871 it was 76 per cent.

On the other hand, marriages in the Superintendent Registrars' offices, involving no religious ceremony whatever, have steadily increased from 2·3 per cent. of the total in 1841-45, to 8·9 per cent. in 1866-70, and to 9·7 per cent. in 1871. The corresponding proportions of marriages in the registered places of worship of Roman Catholics and of other Christian denominations for the same periods were 5·9, 13·9, and 14·0 per cent.; while of Jews and Quakers marrying the proportion remained nearly constant at about ·2 per cent. These facts cannot fairly be regarded as measuring a decline in the influence of the Established Church, because it has to be remembered that the effect of the Registration Act in breaking down the exclusive privilege of solemnizing marriage previously enjoyed by the Church was small at first, the English people being at all times slow to abandon the old ways in which they and their forefathers have walked; while reasons apart from general religious belief may now sometimes induce professing members of the Established Church to avail themselves of the simple legal formality of the Superintendent Registrar's office.

Of the 144,663 marriages solemnized in 1871 according to the rites of the Established Church, ·01 per cent. were by special licence, 11·7 per cent. by ordinary licence, 84·3 per cent. after proclamation of banns; 2·9 per cent. by certificates of Superintendent Registrars, and as regards one per cent. the returns do not show whether the marriage was by licence, banns, or certificate.

As a proof of the great advance towards accuracy which the marriage returns of the clergy now exhibit, it is worthy of note that in the five years 1841-5, the proportion of cases in which the nature of the precedent formality was not stated was 15·9 per cent.; in the succeeding five years it was 12·2 per cent.; in the next quinquennium 4·1 per cent.; and so gradually falling to the one per cent. of 1871. Marriages by special licence fluctuate between 8 or 9 and 23 or 26 in a year, but taking groups of five years the proportion is tolerably constant at about ·01 per cent. The use of the ordinary licence for Church marriages has been relatively diminishing ever since 1856-60, when 155 in every 1000 marriages were by licence, the proportion in 1871 being 117 in 1000. Resort to banns has correspondingly become popular, they having increased from 785 in 1856-60 to 843 in 1871 out of every 1000 Church marriages.*

* "The unsuitableness of banns to the present state of society is commented upon by the Marriage Laws Commissioners in their Report (1868). They say that in populous places it seems universally agreed that no really valuable publicity is attained by banns which afford no safeguard against improvidence, illegality, or fraud, and are frequently, from their great number, an inconvenient and unseemly interruption to divine service. Without proposing that banns should be prohibited the Commissioners recommend that the publication should not be required by law as a con-

Certificates of the Superintendent Registrars have been used for the last 20 years in a proportion which has varied little from about 3 per cent. of all the Established Church marriages. In 1851-5 Roman Catholic marriages constituted 30 per cent. of all the marriages outside the Established Church pale; in succeeding quinquenniums the proportion has fallen steadily to 25, 22, and 18·7, while in 1871 it was further reduced to 16·8 per cent.; the corresponding proportions of marriages in the registered buildings of other Christian denominations have in the same periods been 39, 39, 40, 41·6, and 41·8, per cent. One fourth of all the marriages registered in 1871 in Devonshire, Durham, Cumberland, and Wales, took place in the Superintendent Registrars' offices; in Cornwall, Northumberland, and Monmouthshire the proportion was one-fifth.

First-Marriages; Re-marriages.—Of the 190,112 couples married during the year 155,346 comprised bachelors and spinsters, 8423 bachelors and widows, 16,371 widowers and spinsters, and 9972 widowers and widows. The proportion remarrying was of widowers to every 100 men married 13·9, and of widows to every 100 women married 9·7. First marriages on both sides constituted 82 per cent. of the whole, first marriages only on one side 13 per cent, and re-marriages on both sides 5 per cent.

Fifty marriages took place during 1871 in which one of the parties was stated to have been previously divorced; in 23 of these cases divorced men married spinsters, in one a divorced man married a widow, in 19 divorced women married bachelors, and in 7 divorced women married widowers. No marriage in which both parties had been previously divorced was registered. Altogether during the eleven years 1861-1871 the number of marriages of divorced persons was 356; the lowest return for any of the years was 10 in 1861, the highest 48 in 1865, 47 in 1869, and 50 in 1871. Divorced men re-marry in greater proportion than divorced women, the ratio being about 5 to 4.

Ages at Marriage.—The marriage registers ought in all cases to show the precise age of the parties married, but in 55,098 out of the 190,112 marriages registered in 1871 the age column was filled in with the words "of full age," "minor," or "under age." By law the clergy are required to register marriages according to the form of the Schedule annexed to the Act (6 & 7 W. 4. c. 86), in which form the example given instead of stating the precise age of one or both of the parties describes the man as "of full age" and the woman as "minor" only. And in the earlier years of registration the clergy were perhaps not unnaturally disposed to content themselves with a bare conformation to the letter of the law without regard to the requirements of statistical and legal investigation which needed a more liberal interpretation of the spirit of that law to satisfy. It is gratifying, however, to find that whereas in 1851 the proportion

"dition either of the lawfulness or of the regularity of marriage, being of opinion that " 'every useful purpose which can be answered by the publication of banns in the " 'Established Church may be equally answered by the mere fact of notice to the " 'officiating minister.' That banns afford the greatest facilities for clandestine and " illegal marriages is generally admitted. In large Parishes it is impossible for the " clergyman to make personal inquiries respecting persons who may take up a temporary " or nominal residence for the purpose of having the banns published in the Parish " Church. Hence persons who desire to contract an illegal marriage have only to " choose one of the populous parishes of our large towns, where they readily escape " notice. Any inquiries that are made in such parishes are inevitably left to the parish " clerk whose interest it is not to be too particular in verifying the statements made by " the parties. A declaration similar to that required for marriages before a registrar, " with the penalties of perjury for falsely declaring, would provide some check against " the contraction of illegal marriages."—"The Marriage Law of England," by James " T. Hammick, Esq., Barrister-at-Law (pp. 80-81).

of cases in which the precise ages of the parties married were not stated amounted to 63 per cent. of the total marriages registered, ten years later it had fallen to 37 per cent., in 1867-70 to 32 per cent., and in 1871 to 29 per cent. Instances of unwillingness on the part of bride or bridegroom to divulge their ages must of course be anticipated, but it may be hoped that gradually they will cease to occur as common sense gets the better of a vain wish to hide that which is already probably no secret to the clergyman or registration officer, whose avocations, moreover, would most likely predispose them to regard all such matters of detail from a general point of view rather than as affecting any particular individual. Furthermore, if clergymen and registrars made it a rule to put the question as to age in the form "What was your age last birthday?" instead of "Are you of full age?" the marriage returns would soon exhibit a diminution in the number of cases of unspecified age. The importance of complete statistics of the age at marriage in determining the relative fecundity of populations is obvious.

The tables at pp. 26-8 show the extent to which men and women of proportionate or disproportionate ages married in 1871. "Crabbed age and youth," undeterred by social sarcasm or censure, are found every year mating with one another, and examples are met with in these tables of widowers of 60 and 70 years marrying maidens of 15 and 19; a bachelor of 75 wedding a spinster of 21, and a bachelor of 21 marrying a spinster of 70. At the advanced age of 70 years and upwards 238 men and 32 women entered or re-entered into the matrimonial contract. The mean age at marriage or re-marriage in 1871 was for all the men married 27·9 years and for the women 25·7 years; taking only first marriages the mean age of the bachelors was 25·8 and of spinsters 24·4 years; the mean age of the widowers who re-married was 42·6 and of widows 39·0 years. No perceptible variation has taken place in these numbers during the last five years, notwithstanding the proportion of minors has increased from 6·87 men and 20·17 women married under 21 years of age to every 100 marriages in 1867 to 7·86 and 21·99 in 1871. Marriages of minors bear nearly twice as large a proportion to the total marriages now as they did in 1841.

In my next Report, with the Census returns of conjugal condition and age before me, I shall be able to discuss the question of the tendency to later or earlier marriage among the population much more satisfactorily than on the present occasion when those returns are not available. The relative number of early marriages varies greatly in different parts of the country; in 1871 men under age constituted 3·9 per cent. of all the men married in London, whereas in the county of Bedford the proportion was 14·3 per cent.; of women married the smallest proportion under age was 12·5 per cent. in North Wales, the largest 33·6 per cent. in Durham. Some counties are remarkable for maintaining a high proportion of early marriages; for example, Bedford, Leicester, Nottingham, Stafford, and Northampton as regards males, and Durham, Stafford, the West Riding, and Huntingdon in respect of females have for three years successively exhibited the highest proportions of marriages under age.

Signature of marriage registers.—The simplest form of writing, that which everybody who masters the art of shaping letters endeavours first to accomplish, is the individual signature; and as numbers of persons succeed in this without making farther progress, it follows that the proportion of signatures to marks in the marriage registers as an educational test conveys too favourable an impression of the actual condition of the population. When it is found, therefore, that 194 out of every 1000 men, and 268 out of every 1000 women married in 1871 avowed inability to sign their names in the marriage registers, it may be taken for granted

that those who *could* have written their names, but preferred to make a mark only, were not more numerous than those whose calligraphic power was limited to their signature.

Aware that the inferences as to educational condition deduced from the marriage returns are subject to limitation, I have nevertheless from my earliest Reports down to the latest not hesitated to put them forward as conveying an approximate idea of the degree of ignorance prevailing among the lower classes. In my Thirty-first Annual Report (pp. xxxvi—xliv) will be found brought together in one view extracts from previous Reports bearing upon this subject; and it will probably be conceded, that in thus repeatedly calling public attention to such evidence of defective education, this Department has incidentally helped to strengthen a movement certainly not within the original design of the Registration Act, but of immense national importance, namely, that in favour of State education for the poor. The Legislature has now decreed that every child in the country shall be brought under educational influences, and the effect of this wise provision should ultimately be seen in the decline of the proportion of marks in the marriage registers, until all the marriageable people of the pre-educational period have given place to generations of men and women capable not merely of writing their names, but instructed in other essential branches of knowledge, the possession of which can hardly fail to raise the national standard of morality as well as of intelligence.

As the year 1872 will form a new point of departure in educational matters, it may be useful to show here the extent of the improvement which has taken place as regards the substitution of signatures for marks in the marriage registers between 1841 and 1871.

YEARS.	To 100 Marriages the Mean Annual Proportion of Cases in which a Mark instead of a Name was written in the Register.	
	MEN.	WOMEN.
1841-45 - -	32·6	48·9
1846-50 - -	31·4	46·2
1851-55 - -	30·2	43·5
1856-60 - -	27·1	38·1
1861-65 - -	23·6	32·9
1866-70 - -	20·5	28·3
1871 - -	19·4	26·8

In Table 5 (p. xliii) it will be seen that the smallest proportion of men married in 1871 who could not write was in London, Westmorland, Rutland, and the extra-metropolitan parts of Surrey and Middlesex; of women in Rutland, Middlesex, and Surrey (extra-metropolitan), Sussex, and Westmorland.

And the best proof that the marriage returns do yield approximately reliable evidence of educational deficiencies is the fact, that year after year the same localities preserve a uniform character whether of high or low proportions of signatures. If the question of signature or mark were one of timidity, or of mere caprice with the men and women who marry, it is inconceivable that whole counties should maintain for years the same position relatively to one another as they are found to do.

Thus taking the three equi-distant periods 1851, 1861, and 1871, and noting the ten counties which in each year show the highest proportion of marks as distinguished from signatures, the following results are obtained, separately for men and women married:—

Marriages.

Eight out of the ten counties in the above two groups (for men and women) are the same in each of the three years, thus showing conclusively that it is not merely an accidental circumstance that so many husbands and wives in those counties do not write their names in their marriage registers ; while the fact that in every one of the counties the proportion of marks has steadily diminished points irresistibly to the conclusion that backwardness of education is the only sufficient explanation of the position in which these counties stand relatively to the rest of the country, and that a gradual advance in education will alone account for the diminished proportion of marks in different years in the same county.

Buildings registered for marriages.—There were 215 buildings registered in 1871 for the solemnization of marriages ; of these 8 were Presbyterians, 33 Independent, 26 Baptist, 18 Roman Catholic, 7 Unitarian, 54 Wesleyan Methodist Original Connexion, 5 Wesleyan Methodist New Connexion, 23 Primitive Methodist, 2 Bible Christian, 13 Other Wesleyan, 12 Calvinistic Methodist, 3 New Jerusalem Church, 3 Catholic and Apostolic Church, and 8 other places of worship. The total number of such buildings on the register on 31st December 1871 was 6640. The distribution of these buildings under the various denominations, throughout the counties, will be found on reference to Table 8 (p. lxxvii).

Certified places of worship.—It is no longer indispensable that places of meeting for religious worship should be certified to this Department, but the process is attended with so trifling an expense (the fee being only 2s. 6d.), while the advantages of certification are by no means insignificant, that probably there are very few which do not come under official cognizance. Thus every certified place of worship is wholly freed and exempted from the operation of the “Charitable Trusts Act, 1853 ;” it is exempt from levy of rates and taxes, unless “beneficially occupied” by any person ; its congregation is placed under the protection of the law against disturbance of its services or injury to the fabric. Furthermore certification is essential as a preliminary to the registration of any place of worship (the churches and chapels of the Establishment always excepted) for the solemnization of marriage.

The number of places which having been so certified were on the register on the 31st December 1871 was 18,528, and the following is a

list of the various designations adopted by the denominations for the purpose of registry. Obviously some of the 115 distinctions shown in this list can hardly be taken to indicate difference of denomination; for example "New Church," "New Jerusalem Church," and "Swedenborgians" represent in reality but one sect or creed, namely, that of which Swedenborg was the founder. Some of the denominations represent only a single congregation. The names printed in italics have been added since the last publication of the list in the 29th Report.

BIRTHS.

The number of children born alive and registered during the year 1871 was 797,428, or 4,641 more than in the year preceding, and 101,022 more than were registered in 1861.

The growth of the population is so steady that the comparison of one year's registration returns with those of its immediate predecessor conveys a much less striking impression of progress than a retrospect of 10 or 20 years. In the 10 years 1851-60 the average annual birth-rate to every 1000 persons living was 34·2; in the 10 years 1861-70 the rate increased to 35·2; in 1871 it was 35·0. All the counties of the Second, Third, Fourth, and Fifth Divisions, as a rule, produce less than the average proportion of births; they did so in 1871. London generally approximates nearly to the average, but in 1871 its birth-rate (34·5) was below that of any year since 1862; it was over 36 per 1000 in 1867 and 1868, and was stationary at 35·4 in 1869 and 1870; the marriage-rate was unusually low in London in 1869 and 1870, and although it was raised in 1871 it was then much below the rates for 1864-67. Among the counties of lowest birth-rate, Herefordshire almost always stands out prominently; while Durham, Staffordshire, the West Riding, and Lancashire, are examples of a uniformly high birth-rate. The number of married women of the childbearing ages will no doubt be found to vary considerably in the cases of extreme differences of birth-rate.

Sex.—The birth registers have established the fact that more boys than girls are born, the proportion over a series of years being in round numbers 104 boys to 100 girls. Sometimes, but only twice within the last 20 years, the ratio becomes 105 to 100, while on two occasions (1871 and 1868) it has fallen below 104 to 100. Disregarding particular years, to avoid the interference of exceptional circumstances, it is found that on an average of ten years (1861–70) Cornwall, North Wales, Northumberland, Cumberland, Rutland, and Northampton have the largest proportion of male births; Hertford and Huntingdon counties the smallest. As between legitimate and illegitimate births the latter are proportionally the more productive of male children.

Children born out of wedlock.—Illegitimate births to the number of 44,775 were registered in 1871, amounting to 5·6 per cent. of the total births registered. Twenty years ago they were close upon 7 per cent. of the total births; in the 10 years 1851–60 they averaged 6·5 per cent.; in the following 10 years 6·1 per cent.; so that from whatever cause there has been a gradual and uninterrupted falling off in these evidences of human frailty. I have no grounds for supposing that the general diminution in the illegitimate birth-rate is caused by any increase in the omissions to register; on the contrary, I think that as in those elements of registration which we have the means of accurately observing, undoubted progress in the direction of greater completeness has taken place, it is fair to assume with respect to the registration of illegitimate births that at any rate no more of them are lost sight of now than in former years. In London little or no variation in the rate of illegitimate birth has taken place in 20 years; it amounts to about 4 per cent. of all the births, which is markedly less than the average for the whole country, partly for reasons, no doubt, which will be sufficiently obvious to all who are familiar with life in great cities, but which do not lie within my province to discuss.

The lowest proportions of illegitimate births registered in 1871 were 3·8 and 3·9 per cent. in the extra-metropolitan parts of Middlesex and Surrey; the highest 9·7, 9·4, 9·2, and 9·1 respectively in the counties of Cumberland, Norfolk, Westmorland, and Salop. In a series of years 1852 to 1871 the average annual ratio of illegitimacy is found to be low in Middlesex, Surrey, and Kent, both intra and extra-metropolitan, as well as in the counties of Hants, Gloucester, Warwick, Durham, and Monmouth: the counties of highest rates are Bedford, Suffolk, Norfolk, Hereford, Salop, Leicester, Lincoln, Nottingham, East and North Ridings of York, Cumberland, Westmorland, and North Wales. It will be seen from the following statement that in most of the counties where illegitimacy abounds very little, if any, improvement has taken place of late years.

	Average Annual Per-centage of Illegitimate Births to Total Births.	
	1852–61.	1862–71.
Cumberland - - - -	11·0	11·1
Norfolk - - - -	10·5	10·2
Westmorland - - - -	9·8	9·9
Salop - - - -	9·7	9·4
North Riding - - - -	8·8	9·0
Nottingham - - - -	9·0	8·5
Hereford - - - -	9·5	8·2
North Wales - - - -	7·8	8·0
Lincoln - - - -	7·9	8·0
Bedford - - - -	7·8	7·8
East Riding - - - -	7·6	7·5
Northumberland - - - -	7·6	7·3

Seasons.—The birth-rate is usually highest in the first three months, or the winter (March) quarter of the year; taking the mean of each of the quarterly rates during 34 years, the average annual births to 1000 persons living were 35·4 in the March, 35·1 in the June, 32·5 in the September, and 32·3 in the December quarters. On 10 occasions in the last 30 years the birth-rate in the second quarter was higher than in the first; similarly there were 10 fourth quarters of higher birth-rate than the third.

DEATHS.

The number of deaths registered in 1871 was 514,879, or 450 less than were returned in 1870 out of a population which is estimated to have increased by 281,496 in the following year. The excess of births over deaths registered in 1871 was 282,549; with the exception of the years 1867 and 1868, the greatest balance on the side of growth ever recorded in any year since registration was instituted in this country. To every 1000 of the population there were 22·6 deaths in the year, the mortality having been slightly below the rate for 1870, while it was also a little above the average annual rates in 34 years. Such average, represented by the mean of 34 annual rates, was 22·4 per 1000; in 16 years of lowest mortality since 1840 the average annual rate was 21·5, in 14 years of highest mortality 23·4; the year 1871 approached more nearly to the high than to the low average. In the most unhealthy year (1849) of the series there was 1 death to every 40 persons living, in the healthiest year (1856) 1 in 49. Table 2 (p. lxi) shows that the healthy and unhealthy years do not alternate singly but mostly in groups of three or four years; a reason for this appears in the fact that the death-rate is to a great extent governed by the mortality from zymotic diseases and that an epidemic of either of these commonly takes two or more years to run its course. What diseases were prevalent in 1871 and the degree in which they severally influenced the death-rate, will be gathered from the customary analysis by Dr. William Farr, F.R.S., of the causes of death, appended to this Report. (See Appendix, pp. 219-224.)

Sex and Age.—The 514,879 deaths registered in 1871 comprised 265,563, or 51·6 per cent. of males, and 249,316, or 48·4 per cent. of females. Males constitute 49 per cent., females 51 per cent. of the living population, and the ratio of males dying to males living in 1871 was 23·9 per 1000, of females dying to females living 21·3. So taking the deaths alone the proportion of males to females dying was as 107 to 100, but having regard to the larger number of females in the population out of which the deaths occurred, the proportion of male to female deaths out of equal numbers of both sexes living was as 112 to 100.

The rate of mortality at all ages among males has somewhat increased of late years, while the female rate has diminished.

Tables 19 and 20 (pp. lxxviii-ix) show the ages at which the deaths in every year from 1838 to 1871 inclusive have occurred, and subsequent Tables (21-24) show the proportion which those deaths bore to the living at the several ages calculated upon the basis of the Census returns of 1841, 1851, 1861, and 1871. I have already remarked* upon the extreme importance of these data, which will increase in value as they continue to accumulate. No other great country, as far as I am aware, except Sweden, possesses so comprehensive and trustworthy a guide for the determination of those questions of public health and provident finance in which the duration of human life is a fundamental element.

The ages of the population at the Census of 1871 having now been ascertained, the rate of mortality of the two sexes at different ages in 1871 and in each of the years back to 1861 is given in the Tables. As before stated, of males in 1871 the deaths at all ages were at the rate of

* See pp. v and vi.

23·9 per 1000 living; of females 21·3. In the first five years of life the male rate was 71·7, the female 62·4; at ages 5 and under 10 years 8·3 and 7·5; at 10-15 the rates are at their lowest, 4·4 for males, 4·5 for females; at 15-25 both sexes experienced a nearly equal mortality, 7·7 and 7·4; thenceforward both male and female rates increase to the end of life, the male being invariably highest, as at 25-35 male 11·1, female 9·7; at 35-45 male 14·4, female 12·3, and so on.

Comparison of the mortality in 1871 with the average annual rate in 1861-70 shows for males a diminution of nearly 2 per 1000 in the rate of deaths at ages 0-5, an increase of about 1 per 1000 at ages 25-65, and a decrease at the more advanced ages; the female rate in 1871 at ages 0-5 was 1·4 per 1000 below the ten years' average, at ages 5-55 there was no difference worthy of note, at 55-65 there was an increase, and at 75-95 a decrease. The rates at the extreme ages of 95 years and upwards fluctuate greatly in consequence of the relatively small number of cases coming under observation.

The interest which attaches to cases of reputed centenarianism has induced me to bring together into one view the particulars of such cases as were recorded in the death registers of 1871, and these will be found in Table 18 (p. lxxvii) localized so as to admit of their being easily traced by any one who may be desirous of making inquiry respecting them. From time to time I have to announce in my Weekly, Quarterly, and Annual Reports the deaths of persons whose ages *as stated in the registers* amount to or exceed 100 years. It will not be deemed superfluous by those who take note of the newspaper correspondence which so frequently follows the announcement of a case of extreme longevity, for me to remind the public that the district registrars have no authority, even if they had the means and the leisure for so doing, to investigate the truth or otherwise of the statements as to age made by the legal informants of deaths; the informants are alone responsible for the correctness of those statements. As a most able and pains-taking writer upon this subject in his recent work remarks: "The Registrar General has no alternative but to tell the tale as it is told to him."* In 1871 the deaths of 69 persons were registered at the following ages, *as stated by the informants*; 27 at 100, 17 at 101, 10 at 102, 5 at 103, 3 at 104, 2 at 105, 2 at 106, 1 at 107, 1 at 108, and 1 at 109 years. Of these reputed centenarians 25 were males and 44 females. From 1861 to 1871 inclusive the registered deaths at 100 years of age and upwards have amounted to 856, namely, 231 males, and 625 females; so that on an average 21 men and 57 women go to their graves every year with the renown of centenarianism attaching to their memories. And the Census returns show that about 180 persons out of the entire population would, on enumeration; return themselves as having attained their hundredth year of life; the annual rate of mortality at this advanced stage would therefore be about 43 per cent. By the English Life Table the mortality at the ages 100 and upwards would be 58 per cent., and that implies 116 deaths annually out of 200 living. There is evidence † that it would be unsafe to attempt to draw any precise conclusion as to the limit of the duration of human life from the unverified statements of individuals in the death registers; all that may be said with certainty is that instances such as that of Jacob William Luning whose death in 1870 at the age of 103 years was clearly established by documentary evidence submitted to me and published in my Weekly Return, show that the limit of life is not absolute at 100 years, however exceptional may be the cases in which it is exceeded.

* "Human Longevity," by W. J. Thoms, F.S.A.

† Mr. Thoms gives examples of 30 cases investigated by him: 4 only of these turned out to be demonstrably centenarians; 4 were doubtful; 22 are either disproved absolutely or are shown to be unsupported by proof.

It is worthy of note that the experience of Life Assurance Societies in this country supplies only one example of an insured life completing its hundredth year, namely that of Jacob William Luning above referred to. The difficulties attending an investigation of cases of reputed centenarianism are no doubt considerable, but the question is one of scientific importance and I shall at all times be glad to receive any really valid corroborative proof of such extreme longevity.

Seasons.—Over the years 1838 to 1871 inclusive the quarterly distribution of the deaths has been such as to yield an average annual rate of 25·0 per 1000 in the first, 22·1 in the second, 20·7 in the third, and 21·9 in the fourth quarter. In 1871 the rate was below the average in the March and June quarters, and above in the September and December quarters. Departures from the rule of the first (or winter) quarter being that of highest mortality have occurred only three times, namely in 1846, in 1849, and in 1868: the third (or summer) quarter has exhibited the lowest death-rate in every year save 1846, 1849, 1854, 1868, and 1870. Detailed information respecting the meteorology and evidences of the registration returns in the four quarters of 1871 is contained in the "Summary of the Quarterly Reports" given in subsequent pages (xxviii—xlvi).

Locality.—An average annual death-rate of 22·6 per 1000 for the whole of England and Wales is the expression of a mean of rates differing widely, the range being greater or less according as the units of comparison are large and comprehensive like the Registration Divisions, or are selected for special representative purposes such as urban and rural, densely and sparsely populated, healthy and unhealthy places. Thus, the group of South Eastern Counties forming the Second Registration Division experienced in 1871 an average mortality of 18·8 per 1000, while in the Eighth Division which comprises Cheshire and Lancashire the rate was 26·7. In four of the Divisions with an aggregate population in 1871 of 10,453,107 the mortality was above the average rate (22·6) for all England; below in the remaining seven Divisions containing 12,259,159 persons. The mortality in these great sections of the Country remains tolerably constant on an average of years, the relative position of each Division in the scale of high or low mortality being for the most part determined by the degree in which the component populations are aggregated in large towns or dispersed over agricultural districts. In ten out of the eleven Divisions the mortality in 1871 differed to no appreciable extent from the average of preceding years; but in the Tenth Division there was a large increase, which is found to have occurred in the two counties of Durham and Northumberland and to have been mainly due to a severe epidemic of small-pox.

The Counties as units of comparison give a range of mortality in 1871 from 17·3 and 17·8 in the extra-metropolitan parts of Surrey and Kent, to 27·5 in Lancashire and 28·5 in Durham. Sixteen Counties have an average annual death-rate below 20 per 1000.

A more useful, because a more specific comparison than either of the foregoing, is that between populations living under well defined and opposite conditions, such as is obtained by contrasting the Urban with the Rural parts of the country. Nearly thirteen millions of people are comprised within districts or sub-districts wherein the chief towns are situate, and the death-rate among these in 1871 was 25·0 per 1000, or slightly in excess of the annual average; amongst the residue of nearly ten millions inhabiting the smaller towns or scattered over the purely rural districts the rate was 19·5, or slightly below the average. For general purposes this comparison may be taken as giving a fair idea of the relative advantage as regards the duration of life which a residence in the country confers over one in towns; bearing in mind, of course, that there are

special causes of unhealthiness in some country places and that the towns themselves have a wide range of death-rate.

In the "Summary of the Quarterly Reports," subsequently given (pp. xxviii–lxviii) will be found detailed remarks upon the sanitary condition of different localities as indicated by their death-rate in each quarter of 1871, together with such conclusions relative to the marriages and births as seemed to be deducible from the observed facts. And with regard to the large cities and towns, of which a selection of seventeen has been made, with London at their head, I have nothing now to add to the comments wherewith I prefaced my Annual Summary of the Weekly Returns for 1871, and which are hereto appended (pp. xlvi–lv).

Deaths in Public Institutions.—Within 707 workhouses, 346 hospitals, and 82 lunatic asylums, there were altogether 46,556 deaths registered in 1871, or 9 per cent. of the entire number of deaths which occurred in all England; the corresponding proportion in 1870 was 8·3 per cent., but the number of institutions brought into account for that year was less by 101 than is comprehended in the return for 1871. This difference arises in great measure from the fact that in the latter year the prevalence of small-pox led to the establishment of many hospitals for the reception of patients suffering from that disease; furthermore the cottage hospital system is being gradually extended, and the increasing attention paid to sanitary matters by local authorities has led generally to more adequate hospital accommodation being provided.

As explained in an introductory note (p. 99) the Table of deaths registered in the principal public institutions situate within the several districts and sub-districts (pp. 100–117) will afford the means of correcting the death-rates and so will be invaluable for purposes of local inquiry. Obviously, there is great disparity in the facilities possessed by the populations of different parts of the country of access to institutions for the relief of their necessities. In London 17·9 per cent. of all the deaths registered in 1871 took place in workhouses, hospitals, or lunatic asylums, in the South Eastern Counties the proportion was 11·2 per cent., in the South Midland 9·3, in the Eastern 7·3, in the South Western 6·6, in the West Midland 7·6, in the North Midland 5·6, in the North Western 9·1, in Yorkshire 5·4, in the Northern Counties 5·7, and in Monmouthshire and Wales 3·5.

PROGRESS OF REGISTRATION.

Names on the Registers.—The records of this Office for the period of 34½ years, extending from the middle of 1837 to the end of 1871, comprehend in respect of their relation to the three great events of life—birth, marriage, and death—upwards of *forty-seven million* NAMES; each name being inscribed in an Alphabetical Index prepared quarter by quarter promptly as the certified copies reach this Office, and so arranged as to give the utmost facility for reference. All that is necessary on the part of an inquirer to ensure the immediate production of an entry of marriage, birth, or death, is that he should give the year in which the event took place and the correct name of the person to whom it relates. Of course in proportion as these two particulars are accurately given will the search for the entry be facilitated. Prior to 1866 these Indexes were prepared by hand-copying on parchment sheets, which were bound up into unavoidably bulky volumes, of which between 70 and 80 were produced yearly; so that by the end of 1865 they amounted altogether to 1741 volumes. The rapidly increasing demands for space which these huge books were thus making, and the limited means at disposal for bestowing them, led to a recommendation from me in 1866 to Her Majesty's Government that in future these Indexes should be printed; this was adopted, and I am gratified to be able to report that after

several years' experience it is found to work admirably, as well on the side of greatly increased comfort to the public in making use of them as on that of departmental convenience. The saving in bulk alone may be estimated from the fact that the space occupied by 50 names in the manuscript Index now takes 500 names in print. To this advantage may be added the not inconsiderable one which print always has over the best manuscript for reference purposes, the diminished liability to errors in copying, and, greatest of all, that the existence of such invaluable documents no longer depends on the absolute preservation of one single copy. I am but doing an act of simple justice in bearing testimony to the admirable manner in which the responsible work of printing the Indexes is executed by Messrs. Eyre and Spottiswoode, Her Majesty's printers. The regularity and promptitude exhibited by them from first to last is in my opinion beyond praise.

With such important records in my custody I need hardly say that the utmost possible precautions are taken against mischance by fire or otherwise; but experience teaches that "the unexpected happens" to a very large extent in human affairs, and I may venture to refer to what must under present circumstances always be a source of anxiety to anyone holding the post which I have had the honour for 31 years of filling. I allude to the fact that of the Alphabetical Indexes for 28½ years (1837 to 1865) only one copy exists, and that, consequently, if any accident were to befall that copy, reference to the registers for all those years would virtually be suspended until, after a great lapse of time and at an enormous cost, fresh Indexes were prepared. From 1866 that contingency is at any rate provided against, for of the printed Indexes six copies are now produced at little more than the former cost of the one manuscript copy. It appears to me that it is worthy of consideration by Her Majesty's Government whether it would not be advisable at some future time to make provision for printing the Alphabetical Indexes to the Records of this Office for the years 1837 to 1865 inclusive; primarily on the precautionary grounds above suggested, and additionally because such a step would be gratefully appreciated by the public who, as will subsequently be seen, are every year applying more numerous for certificates. It would also have this further advantage, that it would the better enable me to meet the demands upon the search-room staff of this Office to which its increasing business gives rise.

Registers and Records.—In addition to the ordinary Registers of Marriages, Births, and Deaths, certain other Registers and Records have at various times been deposited in this Office, and are now exhibited to the public on payment of the statutory fees, namely, *one* shilling for the search or reference, and *two* shillings and sixpence for the certified copy of an entry. The following is a list of all the Registers and Records now in my custody:—

1. REGISTERS OF BIRTHS registered in England and Wales on and after 1st July 1837.
2. REGISTERS OF DEATHS registered in England and Wales on and after 1st July 1837.
3. REGISTERS OF MARRIAGES registered in England and Wales on and after 1st July 1837, after solemnization in Churches of the Established Church, in registered Roman Catholic and Dissenting Places of Worship, and in District Register Offices; also of Quakers and of Jews.
4. REGISTERS OF BIRTHS AND DEATHS AT SEA registered since 1st July 1837.

[By the Act 6 & 7 Will. 4, c. 86, sec. 38, every Certificate sealed or stamped with the seal of the General Register Office is to be received as evidence of the Birth, Death, or Marriage to which the same relates without any further or other proof of the Entry.]

The General Indexes of Births, Deaths, and Marriages are completed about nine to twelve months after the date of the Registration, but Searches may be made in the Registers not indexed if the *locality and date* can be accurately stated by the Applicant.]

5. NON-PAROCIAL REGISTERS OF BAPTISMS or Births, BURIALS or Deaths, and (in a few instances) of MARRIAGES, being the Registers or Records kept by various bodies and congregations of Nonconformists prior to the general system of registration commenced in 1837;—comprising amongst others the Registers kept at *Dr. Williams's Library* from 1742; *Bunhill Fields Burial Ground* from 1713; the registers of *French Protestant and other Foreign Churches* in England; the registers, &c. of the *Society of Friends*, &c.

[By the Acts 3 & 4 Vict. c. 92, & 21 Vict. c. 25, *Extracts from these Registers stamped with the seal of the General Register Office are receivable in evidence in all civil cases.* For Searches the description of Register and the locality or name of the Chapel should be given.]

6. FLEET AND MAY FAIR REGISTERS OF MARRIAGES.
7. REGISTERS OF MARRIAGES of British Subjects in FOREIGN COUNTRIES, pursuant to the Act 12 & 13 Vict. c. 68. [The Marriages under this Act are those solemnized since July 1849, at British Consulates abroad.]
8. REGISTERS OF BIRTHS, DEATHS, &c. of British Subjects in FOREIGN COUNTRIES. [These are Registers kept by the British Consuls and other authorities abroad.]
9. REGISTERS OF MARRIAGES in INDIA, pursuant to 14 & 15 Vict. c. 40. [The Marriages under this Act are those solemnized since 1st January 1852, in the presence of Registrars in India. The Marriages by Clergymen of the Church of England are not included.]
10. REGISTERS OF BAPTISMS, MARRIAGES, AND BURIALS kept by ARMY CHAPLAINS at the Military Stations abroad, from 1801 to 1870.
11. RETURNS OF PLACES OF WORSHIP certified to Diocesan Registrars, Clerks of the Peace, &c., prior to 1st July 1852 (19 & 20 Vict. c. 119. s. 24.)
12. REGISTER OF BUILDINGS certified to the Registrar General as PLACES OF RELIGIOUS WORSHIP since 1st July 1852 (18 & 19 Vict. c. 81.)

Searches and Certificates.—The total number of searches (including those relating to the non-parochial and other records) made by the public in this Office during the year 1871 was 17,910, the number of certificates granted was 14,418, and the fees received for the same and paid into Her Majesty's Exchequer amounted to 2,705*l.* 7*s.* In the previous year the corresponding number of searches was 16,170, and of certificates granted 13,127, the fees amounting to 2,456*l.* 19*s.* 6*d.* The non-parochial and other miscellaneous searches form a very small proportion of the whole. Exclusive of these, the searches for entries in the ordinary registers of marriages, births, and deaths have increased in successive periods of five years since 1845 in the following manner:—

Years.				Number of Searches.
1845-9	-	-	-	4,758
1850-4	-	-	-	8,344
1855-9	-	-	-	17,425
1860-4	-	-	-	35,127
1865-9	-	-	-	56,544

The fees for searches and certificates of all kinds, which amounted to 1,721*l.* 4*s.* 6*d.* in the five years 1845-9, had risen to 9,534*l.* 2*s.* 6*d.* in 1865-9. For purposes connected with the Factory Acts numerous searches for registers of births are made and certificates given, free of charge; these are not included in the numbers of searches above mentioned.

The introduction of the competitive system of appointment to clerkships in the Civil Service has no doubt led to part of the recent increase in the applications for birth certificates at this Office, such proof of age being an indispensable condition of candidature. And there is every probability that as years advance, as the registers become more complete and perfect, and as their value becomes more widely known, the public will resort to this Office to a larger extent; its internal organization therefore will need to be preserved in the future, as it has been hitherto kept, in such an elastic condition that it may be capable of expansion from time to time as the exigencies of the case may require. The addition of more than *one million and a half* of new names to the registers every year implies of necessity an increase of work in all the branches of this Department.

UNITED KINGDOM.

The population of the United Kingdom as enumerated at the Census of 1871 amounted to 31,483,700 persons, of whom there were in England and Wales 22,712,266, in Scotland 3,360,018, and in Ireland 5,411,416. Relatively to the area, the proportion of population in each of the three divisions of the kingdom was in 1871 as follows:—England and Wales has 100 persons to every 164 acres; Scotland 100 persons to 580 acres; Ireland 100 persons to 385 acres. The growth of the English population between 1861 and 1871 was at the rate of 13·19 per cent., of Scotland 9·72 per cent.; whereas in Ireland there was a decrease to the extent of 6·68 per cent.

Emigration went on steadily during the ten years, but at a slower rate than in the previous decennium; thus, between 1851 and 1861 the number of British-born emigrants reported to the Emigration Commissioners was 2,054,578, while between 1861 and 1871 only 1,674,594 were so reported, showing a decrease of 379,984 in the latter period. The relation between the excess of births over deaths (or the natural increase), the emigration, and the population enumerated at the Census, is thus exhibited for the United Kingdom:—

Registered births, 1861-70	-	-	-	10,083,719*
Registered deaths, 1861-70	-	-	-	6,414,556*
				3,669,163
Excess of births over deaths, 1861-70	-	-	-	1,674,594
				1,994,569
Excess of births <i>less</i> emigration, 1861-70	-	-	-	28,927,485
Enumerated population, 1861	-	-	-	30,922,054
Estimated population, 1871	-	-	-	31,483,700
[Obtained by adding the difference between the excess of births and the emigration to population in 1861.]				
Enumerated population, 1871	-	-	-	31,483,700
Difference between enumeration and estimate } for 1871				561,646

This implies that there was a certain amount of immigration, and that the birth registers of the United Kingdom are defective. If the deaths and the emigrants are all registered, 56,165 annual births or immigrants are required to make up the number of the population enumerated in 1871.

In 1871 the emigrants of declared British origin numbered 192,751, as compared with 202,511 in the year preceding. There has been an increase of late years in the emigration to the North American Colonies and the United States, while the proportion going to the Australian Colonies and New Zealand has diminished. The sex, destination, and occupation of the emigrants in 1871 will be found stated in Tables 46 and 47 (pp. cii-ciii).

In 1871 the Scotch marriage-rate was 14·2 per 1000, the birth-rate 34·5, and the death-rate 22·2; the marriage-rate was nearly 2·5 per 1000 below that of England, the birth-rates were almost identical, and there was a difference only of ·4 per 1000 in the death-rate in favour of Scotland.

The registered rates of persons married, of birth, and of death in Ireland in 1871 were 10·7, 28·1, and 16·5 per 1000 respectively; these rates differ so widely from those of England and Scotland, as to show

* In order to make up the totals of births and deaths in the ten years for the United Kingdom it has been assumed that the birth and death rates in Ireland were the same during the earlier years of the decade previously to the passing of the Registration Act for that part of the kingdom as during the later years.

either that registration in Ireland is extremely defective, or that the constitution or the circumstances of the population is altogether different from that of Great Britain. How far this latter element operates in the production of the discrepant results above noticed will be seen when it is possible to compare the ages of the people and their conjugal condition in the sister kingdoms according to the last Census returns. Meanwhile I follow the course which in past years has been adopted on the authority of the Registrar General of Ireland, of assuming that the actual marriages, births, and deaths bear the same proportion to the population in Ireland as they do in England.

Thus arrived at, there were in the United Kingdom in 1871 to every 1000 persons living, 16·4 persons married, 35·0 births, and 22·6 deaths.

THE ARMY.

By direction of His Royal Highness the Field Marshal Commanding-in-Chief I am favoured annually with returns relating to the Army. In 1871 the strength of the entire British Army abroad as well as at home was 192,665, of whom 105,757 were serving within the United Kingdom, and the remaining 86,908 were distributed in different parts of the world. The deaths occurring in the year out of the above strength were 1005 at home and 1322 abroad, making altogether 2327. Proportionately to each 1000 of strength there were at home 11·9 deaths of officers and 9·4 of non-commissioned officers and men; abroad 11·4 deaths of officers and 15·4 of non-commissioned officers and men. The mean annual mortality of officers in the six years 1866-71 was at the rate of 10·5 deaths per 1000 at home and 12·6 abroad; among non-commissioned officers and men the corresponding rates were 11·2 at home and 18·3 abroad.

Of the Army at home the mortality rate was considerably less among the 1216 officers stationed in Ireland than it was among the 3664 officers stationed in Great Britain; of non-commissioned officers and men, 26,437 were stationed in Ireland, and their mortality rate was 8·5 per 1000 as compared with 9·7 among the 74,440 stationed in Great Britain.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—Under the Registration, the Merchant Shipping, and the Passengers' Acts, an obligation is laid upon all captains or commanding officers of British vessels to transmit to me the particulars of all births and deaths that occur among English subjects at sea, for entry in the Marine Register Book which is kept for that purpose. In 1871 there were 80 births and 204 deaths so recorded, the greater part of which were reported through the Admiralty from Her Majesty's Ships, and having regard to the number of such occurrences which (as stated below) come under the cognizance of the Registrar General of Shipping and Seamen it is obvious that the law in its present form is virtually inoperative throughout the Mercantile Marine. For in the same year that officer had reported to him by the captains or commanding officers of vessels at the termination of their respective voyages in ports of the United Kingdom 208 births and 421 deaths of British subjects at sea, exclusive of soldiers, marines, invalidated seamen from the Royal Navy, and seamen on ships' articles. The Bill now before Parliament for amending the Registration Acts contains provisions which if sanctioned by the Legislature will, it may be hoped, ensure a more perfect record than now exists of the births and deaths of English subjects at sea.

Mercantile Marine.—The Registrar General of Shipping and Seamen returns the strength of the Merchant Service in 1871 at 199,738 men and boys, exclusive of Masters; and the deaths occurring in the year out of

that strength at 4338, the rate of mortality being equivalent to 21·7 deaths per 1000 of strength. The death-rate shows a further decline on the very high rates of several preceding years, and was in fact lower than in any year since 1864. But that it is and has been for some years excessive, will be evident from a comparison of the two decenniums 1852-61 and 1862-71; the mean annual mortality was 19·2 in the former as compared with 23·1 in the latter period. As the condition of the Mercantile Marine is just now engaging a good deal of public attention it may be worth while to see how that Service compares in point of mortality with the Naval Service and the general home population at corresponding ages. The mean age of the men afloat in the Merchant Service is about 28 years, while that of the men in Her Majesty's Navy is about 26 years, so that there is really little difference between the two in respect of age. Now the mortality among the English male population at the age 28 is by the English Life Table 9·7 per 1000; in the Navy the average annual rate of mortality in the years 1856-72 was 14 per 1000; in the Merchant Service from 1852-71 it was 21 per 1000. Table 58 (p. cix) gives the ages and causes of death of the Merchant Seamen who died in 1871. Of the total 4338 deaths, 858 occurred under 21 years of age, and in 578 cases the age was "unknown." A like element of uncertainty enters into the account of the distribution of the causes of death, 272 of which were "not specified." The number of deaths by accidental drowning was 976 in 1871 and 989 in 1870, by shipwreck 1500 and 1655, and by "other accidental causes" 279 and 302 respectively. The deaths from all specified causes other than disease in 1871 were 2786, by diseases specified 1280; the 272 deaths from causes unspecified may be assumed to belong to the two classes of deaths from disease and deaths from injury or accident in like proportion to the numbers actually specified in the two classes. A comparison of the relative mortality from the two classes of causes in the Merchant Service and in the Royal Navy is subjoined.

	DEATHS PER 1000 OF STRENGTH.	
	ROYAL NAVY. Annual Average, 1856-72.	MERCHANT SERVICE. 1871.
From Disease - - - - -	10·0	6·8
From Injury or Accident (including Drowning)	4·0	14·9
ALL CAUSES - - - - -	14·0	21·7

Thus it appears that in the Navy about two-thirds of the deaths are the result of disease, while in the Merchant Service two-thirds of the deaths are the result of causes other than disease. Among the home population at the sailors' ages the mortality from all kinds of violence does not exceed 1 per 1000. The dangers of the sea are now in the Navy four times, and in the Merchant Service fifteen times, as great as the dangers on land.

WILLS.

It is probably little known that a person coming to this Office to search for the proof of a death having taken place can at the same time learn whether a will has been proved or letters of administration granted for

the disposition of the deceased's estate. By the Act 20 & 21 Vict., c. 77, s. 67, printed Calendars are directed to be made of all Grants of Probate and Administration, with "Notes setting forth the dates of such Grants, the Registry in which the Grants were made, the names of the Testators and Intestates, the place and time of death, the names and descriptions of the Executors and Administrators, and the value of Effects." Under direction of the Court of Probate, in conformity with section 68 of the said Act, a copy of these Calendars is regularly transmitted to this Office, where it "may be inspected by any person on payment of a fee of one shilling for each search, without reference to the number of Calendars inspected."

The Calendars date from the year 1858 inclusive, and are alphabetically arranged under the two heads of "Wills" and "Administrations." In my Twenty-second Report I showed that these Calendars contained information capable of being turned to useful account, analysis of the facts for one year (1858) having demonstrated the wide diffusion of the accumulated wealth in personal property of this country, in opposition to the notion that it is confined to any one class.

From the volume of "Judicial Statistics" for the year 1871 it appears by a Return of the Chief Registrar of the Court of Probate that the number of probates and of letters of administration granted in that year at the Principal Registry was 15,299; in the forty District Registries the number was 24,391; making altogether 39,690 probates and administrations. The value of the property under which these probates and administrations were sworn in the Principal and District Registries combined, amounted to 112,178,935*l.*; the average value under each probate, &c. being 2826*l.*, as compared with a corresponding average of 2696*l.*, in 1870, and 2634*l.* in 1869.

FOREIGN STATES.

France.—Austria.—Italy.—Spain.—The returns of population, marriages, births, and deaths in 1871 for these countries have not yet reached this Office.

Prussia.—Through the courtesy of Dr. Engel, the Director of the Statistical Department at Berlin, I am now enabled to include Prussia among the European States, of whose vital statistics all my later Reports have contained a *résumé*. The population of Prussia in 1853 was 17,065,143, and it had increased to 19,543,540 in 1866: the addition of Schleswig Holstein, Hanover, Hesse, and Nassau in 1867 raised the population to 23,971,337, which in 1871 had become augmented to 24,643,874. Prior to 1866 the increase was at the rate of 1.1 per cent. annually; since 1867 the annual rate of growth has been but 0.2 per cent.

The marriage-rate ranged from 15 to 18 per 1000 between 1853 and 1865, the birth-rate from 36 to 42, and the death-rate from 26 to 32 per 1000. In 1866 there were cholera and war to contend with, and the marriage-rate fell from 17 and 18 in the three preceding years to 15.5 per 1000; the birth-rate of that year was not affected by the combination of evils, but the death-rate was fully 7 per 1000 in excess. In 1867–9 the marriages, births, and deaths approximated to the normal standard. In 1870 the Franco-German war sent the marriage-rate down to 14.5 per 1000, the effect of which is shown in the extremely low birth-rate of 1871, namely 35 per 1000; the death-rate in 1870 was 28.6 and in 1871 rose to 30 per 1000. Speaking generally, there is no considerable difference between the average annual marriage rates of Prussia and England, but the birth and death rates are very much higher in Prussia than with us.

AMENDMENT OF THE REGISTRATION ACTS.

The Bill introduced by Her Majesty's Government in 1872, amending the Acts relating to Civil Registration of Births and Deaths did not become law; but I trust that the measure with the same object in view, under the consideration of Parliament, will this year receive the Royal assent.

In the law at present in force in England and Wales, various improvements may in my opinion be introduced.

I think that the number of qualified "informants" being increased, it should be made compulsory, under a penalty, to effect the registration of every birth and death within a prescribed time after its occurrence.

Also that legally qualified medical practitioners should be required to state for insertion in the Register the cause of death of their deceased patients. When no such written certificate is produced, the Registrar should not record the death unless he be satisfied that it arose from natural causes: and in cases of suspicion or violent deaths he should convey information to the coroner, whose duty it will be to decide whether an inquest is to be held.

Also that a statutory declaration be produced before a registration officer be allowed to correct errors of fact or substance in registers, the present law permitting a practice which I consider too lax in a matter of such importance.

Also that power be given to alter the schedules in the registers, and to change the limits of registration districts when deemed advisable.

With a view to preventing infanticide, I wish new regulations to be enacted as to the burial of stillborn children.

Registration of births and deaths not having been compulsory hitherto in England and Wales, some of these proposed enactments will be proved to be more stringent than the public and registrars have been accustomed to during the last 36 years; but in preparing them for the consideration of the legislature, much consideration has been given to the protection of the public from undue constraint. It has not been forgotten that in England and Wales upwards of 1,300,000 births and deaths occur annually, and that thus a very large number of families will in some measure be affected by this proposed statute; but I know of no milder mode in which *compulsory* registration can be insisted on, which for various reasons Her Majesty's Government have been urged to establish by statute without further loss of time.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

Summary of the Quarterly Reports, 1871.

First Quarter.—January, February, March.

In the UNITED KINGDOM the births of 280,062 children, and the deaths of 184,659 persons of both sexes, were registered in the three months ending March 31st, 1871. The natural increase of population was thus 95,403.

The number of persons married in the quarter ending March 31st, 1871, was 107,070.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriages in the winter quarter of 1871 were much below the average numbers. The births were numerous, but stationary. The deaths decreased both in town and country, as compared with the corresponding quarter of the previous year. Scarlet fever declined, and had it not been for a virulent outbreak of small-pox in London and Liverpool the public health would have shown still more decisive marks of improvement.

Marriages.—The marriages of 72,610 persons were recorded in the March quarter of the year. The annual average rate in the three months was 12.9 per 1000 against 13.2 in the corresponding quarter of 1870. The decrease was not great in any particular division of the country, nor was the increase, which was chiefly exhibited in the manufacturing districts, conspicuous.

Births.—The births of 209,523 children born alive were registered in the first quarter of 1871, and the equivalent annual birth-rate was 37.3, or the same as in the corresponding quarter of 1870. The counties exhibiting a decrease on the average of the three previous corresponding quarters were Kent, Sussex, Huntingdon, Rutland, and Lincoln. The Northern group of counties showed the greatest relative increase.

Increase of Population.—The natural increase of the population, that is the excess of births over deaths, was 71,130 in the three months, or at the rate of 790 per day; and if it were not for the disturbing element of migration, the natural increment would suffice for determining the increase of the population at any given period. Emigration is a fluctuating quantity, not only in successive quarters of the same year, but also in corresponding seasons of different years. 27,741 emigrants sailed from British ports during the quarter, being about 5000 less than in the corresponding period of the previous year. 13,449 of the emigrants were of English, 1869 of Scotch, and 8788 of Irish origin, and 3635 were Foreigners. The number of foreign emigrants was, however, only 100 below that of the previous March quarter. The large proportion of Foreigners was probably owing to the disturbed condition of political affairs on the Continent. The United States attracted not less than seven eighths of the whole, the remainder, chiefly of British origin, went to the Australian Colonies.

Prices, Pauperism, and the Weather.—The average price of wheat was 53s. 7d. per quarter, being higher than it had been since the September quarter of 1868 when it was declining from exceptionally high rates which had ruled during the preceding year. Beef by the carcase averaged 6½d. per lb. and mutton 6¼d. per lb. at the Metropolitan Meat Market. In the quarter ending December 1870 the prices were 6½d. and 6¼d. re-

spectively. Potatoes (York Regents) averaged 87s. 6d. per ton at the Waterside Market, Southwark, being cheaper by 15s. and 17s. 6d. per ton than in the corresponding quarters of the two previous years.

The average number of paupers relieved on the last day of each week in each of the winter quarters of the three years 1869, 1870, and 1871 was as follows :

Quarter ending 31st March		In-door.	Out-door.
1869	-	162,308	- 850,883
" "	1870	- 164,552	- 893,895
" "	1871	- 160,968	- 879,574

The extreme depression of temperature which prevailed at the end of the year 1870 continued in January 1871. Although the mean temperature at Greenwich in January was 33°·2 or 3°·1 below the average of 100 years, the high temperature of February and March raised the mean of the whole quarter 1°·6 above the average of the same period. The lowest temperature was observed at Strathfield Turgiss in Hampshire, where in January it sank to 2°·7, and at Bournemouth in the same county a remarkably sudden rise occurred on 5th January from 13°·7 to 39°·4 in about four hours. Rain fell at Greenwich during the quarter to the amount of 4·3 in., being rather more than half an inch under the average of the same season for the past 56 years.

Deaths; and the State of the Public Health.—The 138,393 deaths registered during the first or winter quarter of the year showed a decline of more than 5000 upon those returned in the corresponding three months of 1870, but considerably exceeded the numbers in the same period of the three preceding years. The mortality was at the annual rate of 24·7 per 1000 persons estimated to be living, against 26°·0 in the first quarter of 1870, and was ·5 below the average rate in the corresponding quarter of the ten years 1861–70.

In the eleven great registration divisions of England the mortality varied from 21 per 1000 in the Eastern and South-eastern counties, to 27 and 29 per 1000 respectively in London, and the North-western counties comprising Lancashire and Cheshire. The rates in each of the eleven divisions, excepting London, showed, however, a decline from those which prevailed in the first quarter of 1870.

The registrars of the 2197 sub-districts of England and Wales reported 21,551 fatal cases of the seven principal diseases of the zymotic class, against 20,091 in the first quarter of 1870; 6086 were referred to scarlet fever, 4903 to small-pox, 4073 to different forms of fever, 2632 to whooping-cough, and 1,476 to measles. The deaths from scarlet fever showed a considerable decline upon the last quarter of 1870, but were only 600 lower than in the first quarter of that year. The fatal cases of fever whooping-cough, and measles, each showed a considerable decline from the numbers in the corresponding three months of 1870, while those of small-pox showed an excess of nearly 4500, of which further details will be found below.

In the urban population of the country, comprising all the chief towns, the annual death-rate was 27 per 1000, while in the remaining, or rural population, it was only 22. Compared with the number of deaths in the first quarter of 1870, the rate in the quarter under review in the large town districts showed a decline of 1°·0 per 1000, while the decrease in the rural districts was 2°·0 per 1000. It is evident, therefore, that the town population did not participate to the same extent as the rural districts in the general improvement in the public health. The epidemic of small-pox which more or less generally prevailed, and was principally confined to large town districts, is the explanation of this fact.

The mortality in the 20 large cities of the United Kingdom, furnishing weekly returns, averaged 29 per 1000, and was higher than in the cor-

responding quarters of the past three years, the increase being largest in Liverpool where the small-pox epidemic prevailed with the greatest severity; in the 17 English towns the rate averaged 28 per 1000. The mortality was low in Portsmouth and Hull, and compared with recent corresponding quarters showed a considerable reduction in Manchester, Leeds, Sheffield, and Wolverhampton.

In the first quarter of 1870 the mean temperature of January was considerably above the average, while February and March were comparatively speaking cold, the mean temperature of the quarter being 38° 0. In the first quarter of 1871 the weather in January was remarkably severe, February and March were warmer than the average, and the mean of the quarter was 40° 2. This difference between the two winters did not materially affect the proportions of deaths occurring among infants and elderly persons. In the 17 largest English towns, of the total deaths registered in the March quarter of 1870, 22 per cent. were of infants under one year of age, and the same proportion of persons aged 60 years and upwards. In the same 17 towns in the March quarter of 1871 22 per cent. of the total deaths were again of infants under one year, while the proportion of elderly persons had fallen to 21 per cent. The per-centage of deaths of persons aged 60 years and upwards during this quarter ranged from 16 in Salford and 18 in Bradford, to 29 and 30 respectively in Nottingham and Norwich. To every 100 births registered in these 17 large towns, an average of 16 deaths of infants under one year of age was registered. Infant mortality, measured in this manner, ranged in the several towns from 10 and 13 per cent. in Portsmouth and Norwich, to 19 and 28 in Sunderland and Liverpool. In the large public institutions (principally workhouses and hospitals) of these 17 towns no less than 16 in each hundred of deaths were recorded; this per-centage ranged from 6 per cent. in Bradford and 7 in Leicester, to 18 and 20 per cent. respectively in London and Liverpool. Rather more than 6 per cent. of the total deaths in these towns were registered upon the information of the coroner, being inquest cases, and 3·4 per cent. were referred to different forms of violence. The proportion of deaths from violence in the several towns ranged from 2 per cent. in Nottingham and Sheffield, to 5 and 7 per cent. respectively in Hull and Birmingham. Birmingham usually shows a high per-centage of deaths from violence, but the proportion during this quarter was unduly raised by the registration of the deaths caused by the fatal accident at a large cartridge factory, which occurred in November 1870; these deaths were not registered until January 1871, registration having been delayed by a lengthened coroner's inquiry.

The epidemic of small-pox which more or less generally prevailed throughout the country was doubtless the most important feature in the death returns for the first quarter of the year. The deaths from small-pox in England and Wales in 1864 were 7684, and steadily declined to 6411, 3029, 2513, 2052, and 1565 in the five following years, 1865-9. In 1869 therefore the fatal cases of this disease averaged rather less than 400 per quarter. In the four quarters of 1870 the 2197 registrars of England and Wales reported successively 405, 446, 500, and 1229 fatal cases of small-pox. The recent epidemic may therefore be said to have broken out in the last quarter of 1870, the 1229 deaths in that quarter having further increased to 4903 in the first quarter of 1871. Of these, 2400 occurred in the Metropolitan division; their distribution in the various parts of London has been dwelt upon in the Weekly Returns. In the SOUTH EASTERN COUNTIES 203 deaths occurred, of which 42 were returned in Brighton, 32 in Croydon, 24 in Southampton, 14 in Medway, and 13 in Kingston. In the SOUTH MIDLAND COUNTIES 102 deaths were returned, of which 11 occurred in Staines, 10 in Uxbridge, 12 in Brentford, and 18 in Edmonton; it will be seen that most of these places are in close proximity to the Metropolitan district. In the EASTERN COUNTIES 88

deaths were referred to this disease, including 60 in West Ham and Epping, also close to London. In the SOUTH WESTERN COUNTIES there were 54 deaths, of which 11 each occurred in Tavistock and Falmouth. Only 40 deaths were returned in the WEST MIDLAND COUNTIES, with their more than two and a half millions of population; the highest district numbers were 9 in Nuneaton and 8 in Oswestry. In the NORTH MIDLAND COUNTIES, of the 25 deaths 18 occurred in Great Grimsby. In Lancashire and Cheshire, the NORTH WESTERN COUNTIES, 1224 deaths were reported, of which 1062 occurred in Liverpool borough, 43 in Ormskirk district (including Southport), 16 in Birkenhead, 18 in Manchester city, and 10 in Northwich. In the three Ridings of Yorkshire, containing over two millions of inhabitants, only 69 deaths occurred from this disease, including 13 in Keighley and 15 in Kirk Leatham sub-district. In the NORTHERN COUNTIES there were 463 deaths, of which 411 were returned in the county of Durham, including no less than 238 in South Shields, also 78 in Stockton, 37 in Hartlepool, 17 in Durham, 15 in Auckland, and 13 in Gateshead; in Northumberland, 25 and 23 respectively occurred in Newcastle-upon-Tyne and Tynemouth. In the WELSH COUNTIES (with Monmouthshire) 235 deaths occurred; of these 141 were returned in Llanelly, 34 in Swansea, and 11 in Llanfyllin. From this resumé of the distribution of the fatal cases of small-pox it will be seen that the epidemic during this quarter was almost confined to four great centres of infection, London, Liverpool, and the mining districts of Durham and South Wales. Nearly all the smaller outbreaks may be more or less directly traced to one of these centres; Brighton, for instance, doubtless suffered from its intimate communication with London. There is distinct evidence in many cases of the introduction of the disease into sea-side towns by sailors, and considering its fatal prevalence in Holland, Belgium, and many parts of France it is not a matter for great surprise that Southampton, Great Grimsby, and one or two other ports suffered from the epidemic. It is indeed very probable that the epidemic in London was due to the large arrivals of French refugees during the latter part of the previous autumn. That the epidemic may to a great extent be traced to our foreign communications is beyond doubt, and it is to be regretted that the steady decline of deaths from small-pox in England in the six years 1864-9, had induced a certain apathy in the matter of vaccination, and thus left a large portion of the population unprotected from the disease. In times of severe epidemic, large numbers of the vaccinated, in some way or other, also suffer for the neglect which has left so many unvaccinated.

It is interesting to compare the mortality from small-pox in various cities during the quarter. The annual death-rate from this disease in the first three months of the year was equal to 3 per 1000 of the estimated population in London, 8 per 1000 in Liverpool, and 13 in South Shields; in Brussels it was 9, in Bombay 1·4, and in New York ·8 per 1000 respectively. Returns from the Dutch towns were only received for January and February; during those two months the annual death-rate from small-pox was equal to 48 per 1000 in The Hague, 36 in Utrecht, 25 in Rotterdam, and 3 in Amsterdam. It is well known that among the lower classes in Holland a very strong prejudice exists against vaccination. It may be useful to inquire what might be the result in London if prejudice against vaccination, which is so strongly held by a few in this country, should ever become so widely spread as in Holland. If the same death-rate from small-pox had prevailed in London during the quarter as existed in The Hague during January and February, the deaths from this disease within the Metropolitan Division would have been 38,828 during the three months, instead of the 2400 which actually occurred.

Scarlet fever, although showing a decline of 5660 fatal cases upon the last quarter of 1870, continued more or less fatally prevalent during the first quarter of 1871, in nearly all the counties of England and Wales;

it was particularly fatal in Faversham, Kings-Lynn, Highworth, Bideford, Redruth, Chesterfield, West Derby, Halifax, Bradford, and the mining districts of Durham and South Wales. Sharp outbreaks of diphtheria occurred in Minhead (Somersetshire) and in Neston (Cheshire). Measles was epidemic in Birmingham, Liverpool, Manchester, and Bedwelty. Different forms of fever were fatally prevalent in Wycombe, Stow, St. Germans, Dudley, Ashby-de-la-Zouch, Guisborough, Whitehaven, East Ward, and Newtown (Montgomeryshire), besides Liverpool, and the mining districts of Durham and South Wales.

Second Quarter.—April, May, June.

In the UNITED KINGDOM the births of 272,603 children, and the deaths of 161,954 persons of both sexes, were registered in the three months ending on June 30th, 1871. The natural increase of population was thus 110,649.

The number of persons married in the quarter ending June 30th, 1871, was 120,902.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriage-rate increased, and reflected the brightening prospects of the people; the births did not attain their usually high average. The public health was satisfactory, and the mortality was below the average in town and country in spite of small-pox, which, as vaccination had been neglected, prevailed in London and some other cities.

Marriages.—The marriages of 97,662 persons were recorded in the June quarter of the year. The annual rate in the three months was 17·2 per 1000 against 15·6 and 16·7 in the two previous corresponding quarters. This increase in the number of marriages was general throughout the country, but it was most marked in the Northern and West Midland Counties.

Births.—The births of 201,165 children born alive were registered in the second quarter of 1871, and the equivalent annual birth-rate was 35·5 per 1000.

The counties exhibiting a decrease on the average of the three previous corresponding quarters were Suffolk, Lancashire, Herefordshire, Wiltshire, Berkshire, Lincolnshire, Northamptonshire, Oxfordshire, and Cornwall.

In London the decrease was 2·4 per cent.

The Northern group of counties, as in the previous quarter, showed the greatest relative increase.

Increase of Population.—The natural increase of the population, that is the excess of births over deaths, was 80,372 in the three months, or at the rate of 883 per day. The rapid increase was moderated by the steady outflow of emigrants. The spring quarter, as in former years, exhibited an augmented stream of settlers in distant lands. Of 108,438 emigrants who sailed from ports in the United Kingdom at which there are emigration offices, 37,876 were English. Of the remainder, 8545 were Scotch, 36,978 were Irish, and 25,039 were Foreigners. The last merely passed through our ports on the way from their own countries. 86,090 sailed to the United States, 18,304 to British North America, 3058 to the Australian Colonies, and 986 to various other places.

Prices, Pauperism, and the Weather.—The average price of wheat rose to 59s. 9d. per quarter, being higher than it had been since the June quarter of 1868, when it began to decline from exceptionally high rates which had ruled during the preceding year. Beef by the carcase averaged 6½d. per lb. and mutton 7d. per lb. at the Metropolitan Meat Market. In

the quarter ending March 1871 the prices were 6½*d.* and 6¼*d.* respectively. The price of beef had risen during the preceding two years 6 per cent. and of mutton 10 per cent. Potatoes (York Regents) averaged 63*s.* 6*d.* per ton at the Waterside Market, Southwark, being cheaper by no less than 31*s.* 6*d.* and 61*s.* 6*d.* per ton than in the corresponding quarters of the two previous years.

The average number of paupers relieved on the last day of each week in each of the spring quarters of the three years 1869, 1870, and 1871 was as follows:

Quarter ending 30th June	In-door.	Out-door.
1869	145,094	816,260
1870	144,385	826,396
1871	140,357	806,186

The extreme depression of temperature which prevailed at the end of the year 1870, and during January of the year 1871, after yielding to spring-like warmth, again became low, and the weather was relatively colder in June than in the former months of the year.

During the three months the average temperature was 1°·6 below that of the past 30 years.

Deaths ; and the State of the Public Health.—In the second or spring quarter of the year, 120,793 deaths were registered in England and Wales. This number was slightly below that returned in the corresponding three months of 1870, but rather more than 4,000 in excess of the average number in the second quarter of the three years 1868–70. The mortality was at the annual rate of 21·3 per 1000 persons living, somewhat lower than in the corresponding quarters of 1869 or 1870, and 0·6 below the average rate in the second quarters of the ten years 1861–70.

In the 11 Registration Divisions of England the mortality ranged from 19 per 1000 in the South Eastern, South Western, North Midland, Eastern, and South Midland groups of counties, to 23 per 1000 in London, and 25 in both the North Western and Northern Divisions. The small-pox epidemic appears to have governed the rate of mortality during the quarter, as its fatality was principally confined to the three last-mentioned Divisions, in each of which the death-rate showed a considerable excess upon the second quarter of 1870, while in each of the eight others there was a marked decline.

The registrars of the 2197 sub-districts of England and Wales this quarter reported 21,420 fatal cases of the seven principal diseases of the zymotic class, against 18,122 in the corresponding quarter of 1870; 7012 were referred to small-pox, 4210 to scarlet fever, 3269 to different forms of fever, 2306 to measles, 2173 to whooping-cough, 1867 to diarrhoea, and 583 to diphtheria. Compared with the numbers in the second quarter of 1870, those reported from small-pox, measles, and diphtheria showed an increase, while there was a decline in the fatal cases of each of the four other diseases.

In the urban population of the country, comprising all the chief towns, the annual death-rate was 23 per 1000, while in the remaining, or rural population, it was only 19. Nearly half this excess in the town death-rates was due to small-pox, which was principally confined to a few towns.

The mortality in the 20 large cities of the United Kingdom, furnishing weekly return, averaged 25·2 per 1000, against 23·6, 24·1, and 23·1 in the corresponding quarters of the three years 1868–70. The largest excess was shown in London, Birmingham, Liverpool, Salford, Sunderland, and Newcastle; this excess was caused in Birmingham by the fatal prevalence of measles, while in each of the other towns it was due to the epidemic of small-pox, the severity of which was proportionally greatest in Sunderland and Newcastle. The annual death-rate from all causes was under 20 per 1000 in Portsmouth, Bristol, Wolverhampton, and Notting-

ham, while in Sunderland, Newcastle, Liverpool, and Glasgow it exceeded 30 per 1000.

In 50 large English town districts, ranking in respect of population next in size to the 17 largest towns for which weekly returns are published, the annual death-rate averaged 24·4 per 1000, and exceeded by 3·1 per 1000 the general rate in the whole of England and Wales. The rate was lower than 19 per 1000 in Yarmouth, Cheltenham, Shrewsbury, Chatham, Dover, Reading, Northampton, Ipswich, Plymouth (including Plymouth, East Stonehouse, and Stoke Damerel Districts), Walsall, Chester, and York. In Southampton, Stoke-upon-Trent, Bury, South Shields, and Gateshead the rate exceeded 25 per 1000; the excess in Bury was due to the prevalence of scarlet fever, and in each of the other towns to an epidemic of small-pox.

The weather during the second quarter of the year was unseasonably cold, and the continuance of north-east wind was unusually long even for an English spring, indeed it may be said to have prevailed throughout the entire quarter, except between the 12th and 29th of April. Excepting that of 1860, the June of 1871 was the coldest on record since 1821. Of the total deaths in England and Wales during the quarter, 22 per cent. were of infants under one year of age, and 23 per cent. of persons aged 60 years and upwards, leaving 55 per cent. as the proportion of children and adults aged between one and 60 years. The seven thousand deaths from small-pox, which is only to a slight extent fatal among persons aged 60 years and upwards, somewhat disturb these proportions, and especially make the proportion of deaths of elderly persons to appear smaller during this quarter than was actually the case. In the 17 largest English towns, of the total deaths registered in the three months ending June, 23 per cent. were of infants under one year of age, while the proportion of deaths of persons aged 60 years and upwards was only 17 per cent.; the low per-centage of deaths of elderly persons in great measure was due to the excess of deaths of children and adults from small-pox. In the several towns the proportion of deaths of persons aged 60 years and upwards ranged from 12 and 13 per cent. in Salford and Sunderland, to 27 and 20 in Nottingham and Norwich. To each hundred births registered in these 17 large towns, an average of 16 deaths of infants under one year of age was registered. Infant mortality, measured in this manner, ranged in the several towns from 11 and 12 in Nottingham and Wolverhampton, to 20·9 and 22·7 in Newcastle and Liverpool. The annual death-rate from the seven principal zymotic diseases, which in the whole of England and Wales averaged 3·8 per 1000, was 5·9 in these 17 largest towns; in Norwich it was only one per 1000, and in Nottingham but 1·4, while it was 5 in Birmingham and Manchester, 6 in London, 7 in Salford, 9 in Newcastle-upon-Tyne, and 13 in Sunderland. Small-pox was the principal cause of this excess in each of the latter towns except Birmingham, where measles was fatally prevalent. No less than 17 per cent. of the total deaths registered in these 17 towns were recorded in large public institutions, principally workhouses and hospitals, against 15 per cent. in the corresponding quarter of 1870; this increase was due to the large number of fatal cases of small-pox which occurred in the workhouses, and in the established or temporary hospitals. The proportion of these deaths in institutions ranged from 7 per cent. in Bradford, to 17 in Wolverhampton and Liverpool, and 21 in London. Six per cent. of the deaths in these 17 towns during the quarter were registered upon the information of the coroner, being inquest cases. The proportion of deaths from all forms of violence in the 17 towns averaged rather more than 3 per cent.; in Leicester the proportion was only one per cent., while in Bristol and Wolverhampton it was 4·8, and in Birmingham 5·0 per cent.

The recent epidemic of small-pox which may be said to have broken out in the last three months of 1870, caused 1229 deaths in England and

Wales during that quarter. In the first three months of the year 1871 they rose to 4903, and in the quarter ending June they further increased to 7012. Of these, 3241 occurred in the Metropolitan Division, 1120 in the North Western Counties, and 1069 in the Northern Counties; the remaining 1585 were distributed among the seven other registration divisions. It will thus be seen that the principal centres of infection were the same four that were noticed in the Quarterly return for the first three months of the year. London, from which the disease spread into the extra-metropolitan portions of Middlesex, Surrey, and Kent, and also into that part of Essex adjoining the East end of London. Liverpool, from which the infection extended to a considerable number of the other towns in the densely populated Lancashire district, including Manchester, Salford, Bolton, and Wigan, and also, but slightly, into Birkenhead. The third principal centre of infection was the coal districts of the North, more notably the towns of Newcastle, Sunderland, Stockton, and Durham. The fourth distinct outbreak was in the mining districts of South Wales. In London the deaths from small-pox increased from 2400 in the first to 3241 in the second quarter of the year; in Lancashire and Cheshire they declined from 1224 to 1120; they rose in Northumberland and Durham from 461 to 1022; while in South Wales they declined from 207 to 109, although the fatal cases had increased in Swansea. Of the other and smaller outbreaks which cannot be directly traced to any of the above four centres of infection, the following are the most important. Southampton, where the deaths from small-pox increased from 24 in the first quarter of the year to 229 in the quarter ending June; Weymouth, where from two in the first they rose to 39 in the second quarter; Falmouth, which showed an increase from 11 to 27; Bridgwater, which showed 12 deaths in the second quarter; Oswestry, in which 14 deaths occurred in the second quarter; Stoke-upon-Trent, in which district 103 occurred in the second quarter against but one in the first quarter; Nuneaton, in which the numbers were respectively 9 and 26; Coventry, which showed 4 and 14; and Great Grimsby, in which the deaths rose from 18 in the first quarter to 164 in the three months ending June. The three Ridings of Yorkshire, comprising the ninth Registration division, with its more than two and three quarters millions of population, had up to this time comparatively escaped the effects of the small-pox epidemic; in the first quarter of the year the deaths from this disease in Yorkshire were but 69, while in the three months now under notice they had only increased to 98; of these, 21 occurred in Bentham, and 20 in Kirk Leatham sub-districts, the former in the West, and the latter in the North Riding.

In order the better to compare the degree of fatality from small-pox in various parts of the country, it is necessary to take the several populations into account. In the first quarter of the year the annual death-rate from this disease was equal to .9 per 1000 in the whole of England and Wales; in the three months ending June it rose to 1.4 per 1000. During the June quarter the death-rate from small-pox was 4.0 in the London Division, 1.5 in the Lancashire, 4.3 in Durham, and 2.9 in Northumberland. The annual death-rate from small-pox during the 13 weeks ending 1st July in the different parts of London, after the distribution of the deaths in hospital, was 2 per 1000 in the west group of districts, 3 in the central, 4 in the east, and 5 each in the north and south of London. The death-rates in a few of the larger boroughs which suffered more severely were as follow:—Liverpool 6, Newcastle-upon-Tyne 7, and Sunderland 9 per 1000 persons living. In the following registration sub-districts the death-rates from small-pox were:—Southampton 19, Weymouth 11, Falmouth 8, Longton (Stoke-upon-Trent) 16, Nuneaton 8, and Great Grimsby 22. In nearly all those places which suffered most severely from the epidemic great neglect of vaccination was reported; the omission, however, of the medical profession to state on the certificate of the cause

of death the fact of vaccination or otherwise, renders it extremely difficult to obtain reliable statistics showing the proportion of fatal cases of small-pox in which vaccination had been entirely neglected, or had been inefficiently performed.

Measles showed a fatal prevalence in Birmingham, Manchester, and Salford, Liverpool, Abergavenny, and Bedwelty. Scarlet fever, although showing a decline upon the numbers returned in recent quarters, again exhibited a very general prevalence in the three months ending June, more notably in Lancashire, the West Riding of Yorkshire, Durham, Staffordshire, Essex, Devonshire, and Somersetshire. The greatest fatality from whooping-cough was shown in Lancashire and the West Riding of Yorkshire. The deaths from different forms of fever showed a slight decline upon the corresponding quarter of 1870; Staffordshire, Lancashire, the West Riding of Yorkshire, Durham, and South Wales suffered most from this disease; locally the deaths from fever showed an excess in Walsall, Dudley, Whitwick (Ashby-de-la-Zouch), Warrington, Bishop's Auckland, North Shields, and Swansea. With few exceptions the mortality from fever was principally confined to the large towns. The deaths from diarrhoea registered previously to the 30th June were considerably below the average owing to the low temperature which prevailed throughout that month; and only 26 deaths in the whole of England and Wales during the three months were referred to cholera and choleraic diarrhoea.

Space will not allow a detailed examination of the causes of death in the several registration sub-districts in which an excessive rate of mortality was shown. One instance, however, calls for special notice. In the Much Woolton sub-district of Prescot (457-2), which at the recent enumeration contained a population of 5772 persons, 101 deaths were returned during the quarter, against 29 the average number in the corresponding quarters of the three years 1868-70. These deaths showed an annual death-rate for the three months equal to 70 per 1000 persons living, and included 39 fatal cases of measles, 23 of whooping-cough, and 9 of scarlet fever.

Third Quarter.—July, August, September.

In the UNITED KINGDOM the births of 256,116 children, and the deaths of 155,752 persons of both sexes, were registered in the three months ending on September 30th, 1871. The natural increase of population was thus 100,364.

The registered number of persons married in the quarter ending September 30th, 1871, was 114,546.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The Summer marriages of 1871 increased in number, and the average rate was slightly exceeded. The birth-rate remained somewhat below, the rate of mortality was slightly above, the average of the season. Small-pox, nine times as fatal as in the corresponding quarter of the previous year, was yet less fatal than in the preceding spring quarter. Diarrhoea was excessively fatal in the summer, and a certain number of deaths from simple cholera were registered; but fortunately the Asiatic cholera which ravaged the insanitary cities of Russia and some cities on the Baltic did not find its way to England.

Marriages.—In the September quarter of the year 1871, the marriages of 93,072 persons were registered. The annual rate for the quarter was 16.2 per 1000 which only slightly exceeded the average rate for the summer quarter in the 10 years 1861-70, though it showed a more considerable increase upon the rate of 15.5 which prevailed in the corresponding quarter of the previous year. The greatest increase occurred in Lanca-

shire, the West Riding of Yorkshire, and Cumberland, while a decrease took place in Cambridgeshire, Dorsetshire, Somersetshire, and Shropshire.

Births.—The births of 193,271 children born alive were registered in the third quarter of 1871, and the equivalent annual rate was 33·7 per 1000.

The births were below the average of the three previous corresponding quarters in London, and in the South Midland, Eastern, South Western, and North Midland Divisions; in other parts of England they showed an increase.

The Counties of Suffolk, Hereford, Wilts, and Berks, which exhibited a decrease in number in the June quarter, showed an increase in September.

In London a decrease again appeared equal to 2·4 per cent. upon the average number in the corresponding quarter of the three previous years.

Increase of Population.—The natural increase of the population, that is, the excess of births over deaths was 71,939 in the three months, or at the rate of 782 daily.

Of 71,400 emigrants who sailed from ports in the United Kingdom at which there are Government emigration officers, 32,312 were of English, 5862 of Scotch, and 16,139 of Irish origin; 14,587 were Foreigners, and the nationality of 2500 was not stated. The English emigrants were nearly 3000 more than in the corresponding quarter of the previous year, but those of Scotch origin had declined. Of the English, 91 per cent. sailed to the United States and to British North America.

Prices, Pauperism, and the Weather.—The average price of wheat was 57s. 9d. per quarter, and except that it was 2s. per quarter lower than in the previous June quarter, it was higher than it had been since the middle of 1868. Beef, by the carcass, averaged 6½d. per lb., and mutton 7¼d. per lb. at the Metropolitan meat market. In the quarter ending June, the prices had been 6¼d. and 7d. respectively. Potatoes (York Regents) averaged 68s. 6d. per ton at the waterside market, Southwark; and although rather dearer than in the preceding quarter, they were considerably cheaper than during the corresponding periods of the previous two years.

The average number of paupers relieved on the last day of each week in the summer quarters was much lower in 1871 than it was in the two preceding years:

		In-door.	Out-door.
Quarter ending 30th September	1869	- 137,406	- 781,382
”	”	1870	- 138,283
”	”	1871	- 132,067
			- 769,764

The cold weather of spring reigned, with a few exceptions, through the beginning of summer until it was succeeded on August 5th by 42 days of very warm genial weather running up to September 16th. From this time to the end of the quarter the weather again became cold, and heavy rain fell everywhere. The crops which had been backward were forced by the fine weather rapidly to maturity, and by the end of August a large portion of them had been stacked. Complaints prevailed of the potato disease, and the wheat crop was generally held to be deficient. The rainfall was 8·3 inches, nearly double that of the same period of 1870 but slightly below the average.

Of the 4·1 inches of rain which fell at Greenwich during September no less than 3·3 fell in the last week of the month.

Deaths; and the State of the Public Health.—In the third or summer quarter of the year, ending 30th September, 121,332 deaths were registered in England and Wales: this number was nearly 3000 less than that returned in the corresponding quarter of 1870.

The mortality was at the annual rate of 21·1 per 1000 persons living, against 22·0 in the same period of 1870, and all but corresponded with

the average rate in the same three months of the ten years 1861-70. Temperature exercises an undoubted influence upon the rate of mortality, more especially the extremes of cold and heat in winter and summer. Following an unusually cold June, the mean temperature during July was moderate and ruled somewhat below the average; August, however, was so exceptionally hot that its mean temperature, $64^{\circ} \cdot 8$, was only equalled or exceeded on four occasions during the 100 years 1771-1870. The effect of this heat was shown in the rapid increase of the fatality from diarrhoea.

The annual death-rate from all causes ranged from 17 per 1000 in the South Western, and 18 in the South Eastern and Welsh Registration Divisions, to 25 in the North Western, and 28 in the Northern Divisions. The three first-named Divisions contain for the most part counties of a rural character; while the North Western Division comprises Lancashire and Cheshire, and the Northern includes Durham and Northumberland. The manufacturing towns of Lancashire ordinarily show in the third quarter of the year an excessive death-rate from infantile diarrhoea, and Northumberland and Durham suffered during the quarter under review from a severe epidemic of small-pox.

In the urban population of the country comprising all the chief towns, and including about 13 millions of persons, the annual death-rate was $24 \cdot 0$ per 1000; while in the remaining or rural population the rate did not exceed $17 \cdot 4$ per 1000. The town death-rate was slightly above the average rate in the corresponding quarter of the ten years 1861-70, while that in the country districts was about as much below the average. Town and country death-rates usually show the widest divergence in the summer quarter of the year, owing to the far greater fatality from diarrhoea which prevails among town populations. During this quarter ending 30th September 1871, 21,663 persons died in our large and small towns who would have lived, had the urban death-rate not exceeded that which prevailed in the rural districts. There are many reasons why a town under perfect sanitary organization should show a death-rate fully as low as that which prevails in purely rural districts, but apart from the evils arising from impure water supply, and the difficulties which surround a satisfactory disposal of sewage, thousands of lives are each month sacrificed to ignorance or disregard of the first sanitary principles. The necessity for ventilation in dwellings, more especially where they are small and overcrowded, and for cleanliness of person, and some knowledge of the physical construction and requirements of the human body, should be taught in all our schools. Such instruction would soon have an important bearing on the public health.

In the seventeen largest English towns furnishing weekly returns the mortality during the quarter was 26 per 1000, and differed but slightly from that which prevailed in the corresponding periods of 1869 and 1870, while it was considerably below the rate during the remarkably hot summer of 1868. The lowest rates among these towns were Portsmouth 19, Wolverhampton 20, and Bristol 21; the highest rates Manchester 34, Salford 35, Newcastle-upon-Tyne 38, and Sunderland 46. Diarrhoea was more or less fatal in each of the towns, and small-pox showed especial fatality in Newcastle and Sunderland, while it was also prevalent in London, Liverpool, Manchester, and Salford.

In the fifty large town districts, ranking in respect of population next in size to the seventeen largest English towns, the annual death-rate in the September quarter averaged 24 per 1000, or two per 1000 less than in the seventeen largest towns. The rate was below 19 per 1000 in Dover, Cambridge, Devonport, Bath, Cheltenham, Shrewsbury, and Chester; in Wigan, Bolton, Preston, South Shields, and Gateshead the rate exceeded 30 per 1000. In Wigan, Bolton, and Preston diarrhoea was exceptionally fatal, while South Shields and Gateshead suffered severely from small-pox.

By the returns received from the 2195 registrars of sub-districts in England and Wales it appears that during the three months ending

30th September 1871, 4612 deaths were referred to small-pox, 1688 to measles, 3488 to scarlet fever, 474 to diphtheria, 1845 to whooping-cough, 3362 to different forms of fever, and 15,919 to diarrhoea; thus from the seven principal diseases of the zymotic class, 31,388 deaths resulted during the quarter, against 33,963 in the corresponding quarter of 1870. The deaths referred to scarlet fever, diphtheria, fever, and diarrhoea showed a decrease, while the fatal cases of small-pox, measles, and whooping-cough were more numerous. To simple cholera and choleraic diarrhoea 527 deaths, principally of infants, were referred, against 611 in the third quarter of 1870. Small-pox and diarrhoea caused an exceptionally high mortality in the quarter now under consideration.

The recent epidemic of small-pox first became fatally prevalent during the last quarter of 1870, resulting in 1229 deaths in England and Wales. In the first two quarters of 1871 the fatal cases were 4903 and 7012 respectively. In the three months ending 30th September they declined to 4612, of which 1255 occurred in London, 89 in Hampshire, 82 in Essex, 90 in Staffordshire, 92 in Warwickshire, 92 in Lincolnshire, 555 in Lancashire, 1120 in Durham, and 396 in Northumberland. The fatal cases showed a large increase upon those in the preceding quarter in Durham and Northumberland, and were also somewhat more numerous in the South Western, West Midland, and York Registration Divisions; in all the other divisions they showed a decline. In London the deaths from small-pox declined from 3241 in the second quarter of the year, to 1255 in the third quarter. In the South Eastern Division during the September quarter they were most numerous in Southampton, Gosport, and Dartford. In the South Midland Division in Brentford and Oxford. In the Eastern Division very few fatal cases occurred out of West Ham which adjoins the Metropolitan Division. In the South Western Counties the disease was epidemic in Weymouth, Falmouth, and Bridgwater, but very few fatal cases occurred in other parts of the division. In the West Midland Division the greatest fatality occurred in Oswestry, Stoke-upon-Trent, Wolverhampton, Nuneaton, and Coventry. In the North Midland Counties the fatal prevalence of small-pox was principally confined to Great Grimsby, although a few deaths were also returned at Leicester and Nottingham. Of the 615 deaths from small-pox in Lancashire and Cheshire, 150 were returned in Liverpool, 182 in Manchester and Salford, and the remainder were scattered for the most part among the large manufacturing towns of Lancashire. In Yorkshire the disease showed fatal prevalence in Sheffield, Scarborough, and Kirk Leatham. In Durham the disease was very generally prevalent; Stockton, Durham, Sunderland, South Shields, and Gateshead, being the principal centres of infection. In Northumberland, the towns of Newcastle-upon-Tyne, Tynemouth, and Morpeth suffered most from the disease; in Cumberland it was fatally prevalent in Carlisle and Cockermouth. In the Welsh Division the returns showed fatality from small-pox in Chepstow, Bedwelty, Newport, Swansea, and Brecknock. The information with regard to vaccination or otherwise in fatal cases of small-pox is necessarily incomplete, failing the co-operation of the medical profession. In but a small proportion of the cases does the certificate of the cause of death state whether the deceased has been vaccinated or not; and although the registrars have in some cases been instructed to enter this information in the death register on the authority of the informant, it is to be feared that this is not always reliable. Frequently the informant is not aware of the fact, and it is suspected that in many instances vaccination is falsely stated to have taken place to conceal the neglect on the part of the parents, who have some dread of ulterior prosecution. All the 20 deaths from small-pox in Bridgwater were "not stated" as to vaccination, as were the 16 in Nuneaton, the 15 in St. Helens (Prescot), the 11 in Kirk Leatham, the 22 in Harraton, and also the 10 each in Chepstow and Brecknock. In the districts of Sunderland, South Shields, Gateshead, and Newcastle-

upon-Tyne, 1023 deaths from small-pox were registered last quarter; of these 329 were returned as unvaccinated, 137 as vaccinated, and 557 as "not stated." Great neglect of vaccination is proved by these figures, but the neglect is probably much understated, for whereas there may be considerable doubt whether the whole of the above 137 had been successfully vaccinated, it is pretty certain that but very few were falsely returned as unvaccinated, and inquiry has proved that of the "not stated" by far the larger proportion are generally unvaccinated.

The fatality from diarrhoea which had been below the average for the season up to the beginning of August, afterwards showed a rapid increase, reached its maximum about the end of the month, and continued excessive throughout the rest of the quarter. The annual death-rate from the disease in England and Wales during the three months was 2·8 per 1000, against 3·1 in the corresponding period of 1870, when the mean temperature was 60°·7 instead of 61°·3 as in the quarter ending September 1871. The lower mortality from this disease is probably due to the cold June, and to the moderate temperature during July, which retarded the outbreak of the epidemic. It is somewhat remarkable, however, that whereas the general diarrhoea death-rate in England and Wales was lower during the summer of 1871 than in the corresponding period of 1870, the rate in the seventeen largest English towns, including London, showed an increase. In the seventeen largest towns this rate was 5·1 per 1000, in the fifty next largest towns 3·7, and in the whole of England and Wales, exclusive of these sixty-seven towns only 1·6 per 1000. Of these sixty-seven towns it was under 2 per 1000 in Gosport, Southampton, Oxford, East Stonehouse, Halifax, Newport (Monmouth), Merthyr Tydfil, and Swansea; while it was 8 per 1000 in Preston, Colchester, and Leeds, 9 in Manchester, Salford, Bolton, and Wigan, and 11 in Leicester. With regard to the excessive death-rate from diarrhoea in Leicester, Dr. J. Wyatt Crane, the Medical Officer of Health, denies that it can be due to the insanitary condition of the town in the ordinary signification of those words. He considers that the mortality from the disease is due to a diminished capacity in the individual who is attacked with the disease to withstand its depressing effects, and that it will especially "be greater or less" in proportion to the vigour of the infantile population;" and further that "the excessive diarrhoeal mortality in Leicester, as compared with "that in other manufacturing towns, arises from its position, situated "as it were in a basin, which causes it to suffer from a more extreme "degree of heat." If it be true that the excessive death-rate from diarrhoea in Leicester is due to a want of "vigour in the infantile population," and it is probably true of the infant population of many of our large towns, it becomes a social question of the first importance, which certainly comes within the region of sanitary inquiry, how far this want of vigour in town children is due to causes directly within human control.

Measles, which showed in the September quarter of 1871 a somewhat greater fatality than in the same period of 1870, was most prevalent in Staffordshire, Lancashire, and Monmouthshire. Scarlet fever was fatal in Halstead, Bury Saint Edmunds, Thingoe, and Ipswich Districts; in Brighton, Southampton, Hitchin, several parts of Oxfordshire, Poole, Bodmin, Redruth, Tewkesbury, Wolstanton, Stoke-upon-Trent, Warwick, Oakham, in many of the manufacturing towns of Lancashire and the West Riding of Yorkshire, Darlington, Sunderland, Newport (Monmouth), and Glamorganshire. The fatal cases of different forms of fever were proportionally excessive in the districts of Chippenham, Bideford, Chard, Ashby-de-la-Zouch, Bingham, Liverpool, Leeds, Sunderland, Llanelly, and Holywell. The deaths from whooping-cough were excessive in Plomesgate, Thetford, Birmingham, Newcastle-upon-Tyne, and Haverfordwest.

The 121,236 deaths registered from all causes in England and Wales during the quarter included 37,367 or 30·8 per cent. of infants under one year of age, and 23,536 or 19·4 per cent. of persons aged 60 years

and upwards; in the corresponding quarter of 1870 these proportions were almost identical, 30·9 and 19·4 per cent. respectively. Infant mortality, measured by the proportion of deaths of children under one year, to births registered, was 20·0 per cent. in 1870, and 19·4 in the third quarter of 1871. Infant mortality calculated in this manner was 27·6 per cent. in the seventeen largest English towns, 23·4 in the entire urban population, and only 16·0 in the remaining or rural districts. Among the 17 largest towns, the proportion of deaths under one to births registered ranged from 16·9 and 18·8 per cent. in Wolverhampton and Portsmouth, to 35·1 in Leeds, 35·2 in Liverpool, 37·3 in Manchester, and 46·2 in Leicester. This difference between the average proportion of 16 per cent. among the ten millions of persons living in the rural districts, and the 46 per cent. shown in the borough of Leicester is so remarkable that an exhaustive inquiry into the cause of this terrible infant mortality seems imperatively called for. The inhabitants of Leicester, and of other large towns, should know the cause of this waste of life, the reason why their infants more readily fall victims to diarrhoea and other infantile complaints.

In the large public institutions of England and Wales, including the Workhouses, Hospitals, and public Lunatic Asylums, 9782 deaths were returned, or 8·1 per cent. of the total deaths; in the corresponding quarter of 1870 the number was 9185 and the proportion 7·4 per cent. In the 17 largest English towns the proportion of these deaths this quarter was 12·6 per cent., ranging from 4·6 and 4·9 in Leicester and Bradford, to 11·3 in Liverpool and Manchester, and 16·7 per cent. in London. There is no doubt that some considerable proportion of the deaths occurring in the public institutions of our large towns are of patients admitted from outlying districts, from parishes not included within the several municipal boundaries. Town rates of mortality are thus to a slight extent over-stated, not however more than is balanced by the deaths of domestic servants and other town workers who, when ill, return to their country homes, there die of diseases contracted during their town residence, and are there registered.

Inquests were held during the quarter upon 6032, or 5·0 per cent. of the deaths registered in England and Wales; in the corresponding quarter of 1870, 5526 or 4·4 per cent. were inquest cases. In the 17 largest English towns the proportion of inquest cases ranged from 2·4 and 2·9 per cent. in Sunderland and Wolverhampton, to 5·5 and 7·7 per cent. in London and Birmingham. Different forms of violence caused 4202 or 3·5 per cent. of the deaths in England and Wales; in the 17 largest towns the proportion ranged from 1·4 per cent. in Leicester and Salford, to 3·8, 4·1, and 4·2 per cent. respectively in London, Birmingham, and Hull.

Fourth Quarter.—October, November, December.

In the UNITED KINGDOM the births of 256,439 children, and the deaths of 175,878 persons of both sexes, were registered in the three months ending on December 31st, 1871. The natural increase of population was thus 80,561.

The registered number of persons married in the quarter ending December 31st, 1871, was 143,558.

The marriage, birth, and death-rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The Marriages in the last quarter of 1871 exceeded the ordinary excess of the season. Births abounded, and exceeded the numbers in any preceding autumn, but the average rate was scarcely reached. The deaths were raised to the extent of seven thousand over the average

by the severity of the weather; and the mortality was above the average, especially in the towns of the kingdom. Small-pox, owing to defective administrative arrangements, was, in spite of the Compulsory Vaccination Act, more fatal than any other epidemic: of it more than six thousand died, chiefly children. The deaths by fever, chiefly enteric, occur more among men and women of maturer ages; the number of such deaths was 4692.

Marriages.—In the quarter ending 31st December 1871, 116,880 persons were married, a greater number than had been recorded in any previous quarter. The annual rate was 20·4 per 1000, which was higher than that in any quarter since the corresponding one of 1866, and ·8 above the mean rate for the fourth quarter of the 10 years 1861–70. On comparison with the average number of marriages registered in the corresponding quarter of the three years 1868–70, the English counties in which the greatest increase occurred, in proportion to population, were Nottinghamshire, Durham, Warwickshire, and Monmouthshire, while Westmorland was the only county which showed a decrease.

Births.—The number of children born alive, whose births were registered in the quarter ended 31st December 1871, was 193,469, giving an annual rate of 33·7 per 1000, which is about the average rate for the fourth quarter of the year. As compared with the average of the three previous corresponding quarters, Leicestershire, Nottinghamshire, and Durham were the only counties exhibiting any noticeable increase, and Hertfordshire, Bedfordshire, and Herefordshire those in which any considerable decrease occurred.

Increase of Population.—The excess of births over deaths amounted during the quarter to 59,108 or 642 per day. This represents the natural increase of the population, which would be also the actual increase, if it were undisturbed by emigration and immigration.

The number of emigrants who sailed from British ports at which Government emigration officers are stationed, was 40,114. Of these, 18,621 were of English, 2997 of Scotch, and 9135 of Irish origin, and 9361 were Foreigners. It is amongst this last class that the increase of 1654 over the total number of emigrants in the previous corresponding quarter principally occurred. Emigration to the Australian Colonies again showed a decline.

Prices, Pauperism, and the Weather.—The average price of wheat, which had gradually risen from 42s. 3d. per quarter in the March quarter 1870, to 59s. 9d. in the June quarter 1871, fell to 57s. 9d. in the September quarter, and further declined to 56s. 3d. per quarter in the last three months of the year.

The price of beef and mutton by the carcase at the Metropolitan Meat Market averaged 6½d. and 6¾d. per lb. against 6¾d. and 7¼d. per lb. respectively in the previous quarter. Potatoes (York Regents) fetched an average price of 89s. 6d. per ton at the Waterside Market, Southwark, showing an advance of 21s. per ton upon the price in the preceding quarter, and of 19s. 6d. upon that in the corresponding quarter of the preceding year.

The average number of paupers relieved on the last day of each week of the quarter was —

In-door.		Out-door.
141,027	- -	759,666
against 150,864	- -	804,219

in the previous corresponding quarter.

The last quarter of the year 1871 was remarkable for the longest continuance of low temperature during November and the first half of December in this century. The temperature of the month of October had been nearly a degree below the average, but on the 2d November a period of cold

weather set in of unprecedented length, continuing throughout the whole month. The mean temperature of this month was $37^{\circ}\cdot6$, being $4^{\circ}\cdot7$ below its average derived from 100 years observation. In two instances only, viz., in the years 1782 and 1786, was the mean temperature of November lower than $37^{\circ}\cdot6$, and since the year 1786, that is in the previous 85 years, there had been no instance of such a cold November. The cold continued into December and with severity until the 12th day, the average deficiency of the mean daily temperature from the 1st to the 12th being $9\frac{1}{4}^{\circ}$. On the 8th December the deficiency reached $19^{\circ}\cdot3$, the mean temperature of that day having been $22^{\circ}\cdot4$, while its average is $41^{\circ}\cdot7$.

The rain-fall during the quarter, as measured at Greenwich, amounted to only $3\cdot2$ in., being 4 in. below the average.

The fall of rain in October was only one half of the average for that month; in November it was only one fourth; and in December it was three fifths of its average; thus the rain-fall in each month of the quarter was defective.

State of the Public Health; Deaths.—In the fourth or autumn quarter of 1871, ending 31st December, 134,361 deaths were registered in England and Wales: a considerable excess was shown upon the number returned in recent corresponding quarters, after making due allowance for increase of population.

The mortality was at the annual rate of $23\cdot4$ per 1000 persons living, against $22\cdot2$ the average rate in the fourth quarters of the ten years 1861–70; in those ten years the annual rate ranged from $20\cdot6$ in the last three months of 1861, to $23\cdot5$ in 1864, the latter rate corresponding with that which prevailed during the quarter under review. Independently of the continued fatality from the small-pox epidemic, the unusually severe weather which prevailed during the greater part of November and the first 12 days of December exercised an unquestionable influence upon the mortality of the latter part of the quarter by causing an excessive fatality, especially from diseases of the respiratory organs and phthisis.

In the Eleven Registration Divisions of England and Wales the annual death-rate from all causes ranged from $17\cdot6$ and $19\cdot9$ per 1000 in the South-eastern and South Midland, containing for the most part agricultural counties, to $27\cdot8$ in the Northern and $27\cdot9$ in the North-western Divisions. The largest proportional excess of deaths, upon the average numbers in the three previous corresponding quarters, was shown in the counties of Staffordshire, Monmouthshire, and Durham. In Staffordshire, small-pox was severely epidemic in Wolverhampton, and scarlet fever in Stoke-upon-Trent and Wolstanton; while small-pox was the principal cause of the excess in Monmouthshire and in Durham. In the county of Durham the death-rate from all causes was so high as $31\cdot5$ per 1000.

The principal town districts of the country, comprising all the large towns, contained a population of about 13 millions of persons, among which the annual death-rate for the quarter was equal to $26\cdot4$ per 1000. The remaining or rural population was about 10 millions, in which the death-rate did not exceed $19\cdot5$ per 1000. Compared with the average rate in the corresponding quarter of the ten years 1861–70 the town death-rate showed an excess of $1\cdot7$ per 1000, while in the rural districts the excess was but $0\cdot8$ per 1000. During the three months ending 31st December 1871, in our principal towns 22,585 persons died (26 per cent. of the total deaths) who would have survived had the death-rate in these towns not exceeded that which prevailed in the whole of the rural districts of England and Wales. It is especially this waste of life in towns which it is hoped to control and reduce by effective sanitary legislation. The above figures, however, give but a faint idea of the entire excess of mortality, as the sanitary condition of a considerable proportion of our villages and rural parishes is far from satisfactory. How can it be otherwise where

there is absolutely no system adopted for the disposal of animal refuse, and the only sources of water supply are surface wells? In a selection of the healthiest districts of England the average annual death-rate is found to be 17 per 1000; at this rate the deaths in England and Wales during the four quarters of 1871 would have been 386,926, instead of the 515,096 actually registered. The total excess of mortality over a normal standard during 1871 may therefore be put down as 128,170 deaths, being the difference between the number registered and those which would have occurred if the death-rate during the year had not exceeded 17 per 1000.

In the 17 largest English towns furnishing weekly returns during the quarter the mortality averaged 27 per 1000, and showed a considerable excess upon that which prevailed in the corresponding quarter of 1870; this is principally due to the epidemic of small-pox prevailing in so many of the towns, and causing 2666 deaths, against 773 in the last three months of 1870. The lowest death rates among these towns in the December quarter of 1871 were 22 in Portsmouth, 24 in Hull and Birmingham, and 25 in Bradford; the highest 34 in Nottingham and Norwich, 41 in Sunderland, and 47 in Wolverhampton. Small-pox was fatally epidemic in each of the four last-mentioned towns, as well as in Sheffield, Newcastle-on-Tyne, and to a less extent in London.

The annual death-rate in 50 large town districts, ranking in respect of population next in size to the 17 largest English towns, averaged 28 per 1000, against 24 in the preceding three months, when diarrhoea was so fatal. This increased mortality, and the excess of $1\frac{1}{2}$ per 1000 upon the general urban death-rate, was almost entirely due to the greater fatality from small-pox. The rate was below 19 per 1000 in Chatham, Maidstone, Reading, and Cheltenham; while it exceeded 35 per 1000 in East Stonehouse, Devonport, Stoke-upon-Trent, Preston, Gateshead, and Newport (Monmouth); scarlet fever was the principal cause of this excess in Stoke-upon-Trent, and measles in Preston, while small-pox was epidemic in East Stonehouse, Devonport, Gateshead, and Newport (Monmouth).

The 134,387 deaths registered at all ages, from all causes, in England and Wales, included 30,320, or 22.6 per cent., of infants under one year of age, and 32,535, or 24.2 per cent., of persons aged 60 years and upwards; in the corresponding quarter of 1870 the proportions were 21.7 and 23.2 per cent. respectively. The larger proportion of deaths of infants, and of elderly persons, registered during the quarter under review, was probably due to the greater fatality from diseases of the respiratory organs induced by the unseasonably severe weather which prevailed during the greater part of November and the first half of December. Infant mortality, measured by the proportion of deaths under one to births registered, was 15.7 per cent., against 14.4 in the corresponding three months of 1870. In the 17 largest English towns the proportion of deaths under one to births registered averaged 18.0 per cent., and ranged from 15.5 in Hull and 16.0 in Bristol, to 21.6 in Leicester and Liverpool, and 30.8 in Wolverhampton. This remarkably high per-centage in Wolverhampton may in great measure be the result of the fatal prevalence of small-pox in that town; during the fourth quarter of 1870 the proportion of deaths under one to births registered in the town did not exceed 13.3 per cent.

According to the returns furnished by the 2195 local registrars of the sub-districts in England and Wales relating to the three months ending 31st December 1871, 6380 deaths were referred to small-pox, 3763 to measles, 4408 to scarlet fever, 635 to diphtheria; 2966 to whooping-cough, 4692 to different forms of fever, and 4063 to diarrhoea; thus 26,997 deaths resulted from these seven principal diseases of the zymotic class, against 25,907 in the corresponding three months of 1870. The fatal cases of scarlet fever and diphtheria showed a decline of more than 7000, and of fever nearly 700, while those of small-pox, measles, and whooping-cough

had increased 5151, 1882, and 1211 respectively. The deaths from these seven principal zymotic diseases were equal to an annual death-rate of 4·7 per 1000 persons living in England and Wales; in the 17 largest English towns, including London, the rate from these diseases was equal to 5·9, and in the 50 large towns ranking next in size to 6·6 per 1000. In these 67 towns the zymotic rate ranged from 1·3 per 1000 in Cheltenham and 1·4 in Derby, to 18·9 in Sunderland and 21·7 in Wolverhampton.

The continued prevalence of the small-pox epidemic was again one of the most conspicuous features of the Return. During the six years 1864–9 the deaths from small-pox steadily declined from 7684 to 1565. In the four quarters of 1870 they were successively 405, 446, 500, and 1229, giving a total for the year of 2580. The recent epidemic may therefore be said to have broken out in the last quarter of 1870. During the March quarter of 1871 the fatal cases rose to 4903, in the June quarter to 7012, and after a decline to 4612 in the three months ending September, rose again to 6380 during the last quarter of the year. Thus in the twelve months ending 31st December 1871 no less than 22,907 children and adults in England and Wales fell victims to this disease. Who shall say how much of this mortality, which is entirely without parallel in England during the past 30 years, is directly due to neglect and apathy as to vaccination induced by the comparative immunity from the disease which the nation enjoyed during the three years 1867–8–9? Of the 6380 deaths from small-pox registered during the quarter in England and Wales, 1084 occurred in the county of Durham, 980 in London, 708 in Yorkshire, 474 in Lancashire, 419 in Northumberland, 361 in Staffordshire, 327 in Norfolk, 261 in Devonshire, 247 in Monmouthshire, 183 in Nottinghamshire, 168 in Warwickshire, and 167 in Somersetshire. In Durham, London, and Lancashire these numbers showed a decline upon those in the preceding three months ending September, while there was a considerable increase in most of the other above-mentioned counties. It will be useful briefly to notice the rise or fall of the epidemic in various parts of the country. In London the fatal cases, which fell from 3241 in the second to 1255 in the third quarter, further declined to 980 during the three months ending 31st December; these, however, showed a weekly average of 75, and towards the end of the quarter the weekly numbers were considerably higher than during October and November. The South-eastern Counties, excepting slight outbreaks at Gillingham and Dover, and 38 deaths in Portsmouth and Alverstoke districts, were almost free from the disease. In the South Midland Counties, the fatal cases showed a decline in the extra-metropolitan portion of Middlesex, while they were again numerous in Oxford, and comparatively recent outbreaks occurred at Northampton, Kettering, and Wisbech; Buckinghamshire was the only English county in which no death from small-pox was recorded during the quarter. In the three Eastern counties, Essex, Suffolk, and Norfolk, the disease showed a markedly increased fatality, resulting in 426 deaths against 105 in the three months ending September; in Essex the numbers were lower than in the previous quarter, and, excepting Mutford district, which includes a portion of Yarmouth borough, there was but a slight increase in Suffolk; in Norfolk, however, both Norwich and Yarmouth became centres of infection, and the fatal cases in the county rose from 13 in the September quarter to 327, of which 233 occurred in Norwich; the medical practitioners in that city have so generally omitted to mention the fact of vaccination or otherwise in their certificates of the cause of death, that it is impossible to ascertain the extent to which vaccination has been there neglected. The South-western Counties, more especially Devon and Somerset, also showed a large increase in the fatality from small-pox, the deaths rising from 156 in the September quarter to 536, of which 261 occurred in Devonshire and 167 in Somersetshire; the disease was epi-

demie at Swindon and Bridport, Bideford, Bodmin, Redruth, Bridgwater, Yeovil, and to a slight extent in that portion of Bristol city situated in Bedminster; by far the most important centre of infection, however, in these South-western Counties was Plymouth and the adjoining districts of East Stonehouse and Stoke Damerel, in which 197 deaths occurred. In the West Midland Counties, the fatal cases showed an increase from 212 to 569; the epidemic, however, was principally confined to Staffordshire and Warwickshire, the main centres of infection being Wolverhampton and Coventry, and to a slight extent Birmingham; the fatality was exceptionally severe at Wolverhampton, 267 deaths occurring within the borough. The North Midland Counties showed 234 deaths, against 121 in the preceding three months; Nottingham became a new and important centre of infection during the quarter, and 161 fatal cases were recorded in the borough and its immediate vicinity; the epidemic had all but died out at Great Grimsby and in other parts of Lincolnshire, and the counties of Leicester and Derby were comparatively free from the disease, excepting a slight outbreak at Chesterfield. In the North-western Counties of Cheshire and Lancashire the epidemic showed a slight decline upon the September quarter, but the disease continued fatally prevalent to a greater or less extent in Chester, and in most of the large manufacturing towns of Lancashire; there was a marked decline in Liverpool and Manchester, while the numbers had considerably increased in Prescot, Salford, Oldham, and Rochdale. Yorkshire, in which 129 fatal cases were returned in the September quarter, lost 708 lives in the last three months of the year; of these, 360 occurred within the borough of Sheffield, 40 in Wakefield, 38 in Hull, and 67 at Scarborough; throughout the county an important and general increase was shown. The mining districts of the Northern Counties had been one of the most fatal small-pox fields since the outbreak of the epidemic; during the four quarters of the year 1871 the deaths from this cause were respectively 463, 1069, 1566, and 1546, or 4644 for the whole year; the number showed a slight decline in the December quarter in Durham, but the considerable decrease in both Sunderland and Newcastle was all but balanced by a large increase in Auckland, Easington, and Tynemouth. In the Welsh Division, including Monmouthshire, the fatal small-pox cases rose from 141 in the September quarter, to 539 in the quarter ending 31st December; the most important increase occurred in Monmouthshire, 144 and 75 deaths being respectively returned in Bedwelty and Newport Districts; in South Wales an important outbreak occurred at Neath, causing 118 deaths, and the epidemic was more or less fatal in Merthyr Tydfil, Swansea, Carmarthen, Brecknock, and Crickhowell; in North Wales, except at Holywell and St. Asaph, very few deaths occurred from the disease.

The mere numbers quoted in the foregoing epitome, although indicating those parts of the country in which small-pox was prevalent, and showing whether its fatality was on the increase or decline, afford slender means for judging the rate of mortality from the disease at the different centres of infection. Throughout the year rather more than one in every thousand persons living in England and Wales died from small-pox; during the last quarter of the year the rate averaged 1.1 per 1000. In the 17 largest English towns the 2666 deaths from small-pox were equal to an average annual rate of 1.7 per 1000 of the six millions of the population; the highest rates were 6.0 in Sheffield, 6.1 in Nottingham, 11.7 in Norwich, and 15.6 in Wolverhampton. In the 50 large towns ranking next in size the fatal small-pox cases were 983, and the rate 1.6 per 1000, or almost identical with that in the 17 largest towns; among these fifty towns the highest small-pox rates were 10.3 in Stoke Damerel (Devonport) district, and 13.2 in South Shields, and 8.8 in Newport (Monmouth) sub-districts. In England and Wales, exclusive of these 67 large towns, the deaths from small-pox were 2731 and the annual rate

0·8 per 1000. In many parts of the country the death-rate from this cause was very high, especially in the following registration sub-districts, 13·7 in Houghton-le-Spring, 13·8 in Bridgewater, 14·5 in Whitford (Holywell), 15·8 in Bideford, 16·3 in Wallsend, and 20·0 in Neath.

The 3763 deaths referred to measles in England and Wales during the quarter ending 31st December 1871, showed an increase of 2075 upon the preceding three months, and were 1882 above the number in the fourth quarter of 1870. The greatest fatality was shown in London, Staffordshire, and Lancashire; the deaths were also especially numerous in Folkestone, Plymouth, Birkenhead, and Merthyr Tydfil. Of the 951 deaths in Lancashire the more remarkable sub-district numbers of fatal cases were 91 in St. Helens (Prescot), 121 in Burnley, and 122 in Preston.

Scarlet fever caused 4498 deaths against 3488 in the preceding three months, the largest increase being shown in Cornwall, Staffordshire, Lancashire, Yorkshire (West Riding), and Durham. The disease was fatally prevalent in Newport Pagnell, Chelmsford, Halstead, Thingoe, Poole, Redruth, Wolstanton, Stoke-upon-Trent, West Derby, Bury, Todmorden, Whitehaven, and Pontypridd.

Whooping-cough is usually more fatal during cold weather, and the 2966 deaths in the December quarter exceeded by 1211 those in the corresponding three months of 1870. Manchester, Birmingham, and Bradford showed a considerable fatality, as well as a large proportion of the town districts of Staffordshire, Lancashire, and Durham, which also suffered more or less from small-pox, measles, and scarlet fever.

The 4692 deaths referred to different forms of fever, but principally enteric, also showed an increase of 1330 upon those in the preceding three months, although they were 672 less than in the last quarter of 1870. The increase upon the September quarter was general, and as usual was largest in the town districts; in Nottinghamshire the increase was exceptional, 185 deaths being referred to this head against 88 in the previous three months.

The fatal cases of diphtheria shared the increase shown in those of scarlet fever. Those of diarrhoea exceeded by about 1000 the number in the corresponding quarter of 1870. To English cholera and to choleraic diarrhoea 60 deaths were referred, of which 6 were reported at the village of Carlton near Nottingham, and certified by the medical attendant as English cholera.

This general view of the distribution of zymotic disease in England during the quarter, apart from the small-pox epidemic, can scarcely be said to be satisfactory. The deaths referred to most of these diseases had increased, and thus implied a low sanitary condition. Towns were the greatest sufferers, but villages and rural districts were in many instances, perhaps unconsciously, also suffering from excessive death-rates. Take for example the two registration sub-districts of Missenden and Chesham, situated in the most picturesque part of Buckinghamshire, with so sparse a population that they contain an average of from $2\frac{1}{2}$ to 3 acres to each person living; in Missenden the fatal prevalence of measles and whooping-cough raised the annual death-rate to 44 per 1000; while in Chesham measles and typhoid fever, in addition to the ordinary mortality, produced a death-rate of 49 per 1000. In such rural districts the rate should certainly not exceed 17 per 1000, if their sanitary condition were satisfactory. These are chance examples, and many more striking ones might be discovered by an exhaustive examination of the death-rate in villages and rural parishes. With a proper use of these returns, no part of England and Wales, however remote, need any longer remain in ignorance of its sanitary condition as shown by the proportion of deaths to its population, the number of deaths referred to the principal zymotic diseases, and its infant mortality measured by the proportion of deaths of children under one year to births registered.

In the large public institutions of England and Wales, including Work-houses, Hospitals, and public Lunatic Asylums, 11,531 deaths were returned, or 8·6 per cent. of the total deaths; in the corresponding quarter of 1870 the number was 10,621 and the proportion 8·4 per cent. In the 17 largest English towns the proportion of these deaths averaged 13·6 per cent., and ranged from 5·4 and 6·6 per cent. in Bradford and Sheffield to 14·7 in Liverpool and 16·4 in London. During the quarter 6423 deaths in England and Wales were registered upon the information of the coroner, being inquest cases, or 4·8 per cent. of the total deaths, against 4·9 per cent. in the corresponding quarter of 1870. In the 17 largest English towns the proportion of inquest cases averaged 5·8 per cent., ranging from 1·9 in Wolverhampton to 8·6 per cent. in Birmingham. Different forms of violence, principally the result of accident or negligence, caused 4048 or 3·0 per cent. of the deaths in England and Wales, against 3292 and 2·6 per cent. in the fourth quarter of 1870; the proportion in the 17 largest English towns ranged from one per cent. in Norwich, to 4·5 and 5·2 respectively in Birmingham and Liverpool.

*Health of London and other large Cities in 1871.**

CITIES, although no longer the heads of States, created as in Greece and Rome by their energy, are the seats of government, commerce, industry, trade, science, and literature; in England, too, they comprise a large and an increasing proportion of the nation. Besides the indigenous population, they attract the enterprising part of the people born in the country. Their diseases serve to measure the fluctuations in the health of the whole community, of which they are a part, or with which they are in intimate and constant relation. Hence, while the Returns for other districts are made quarterly, Returns are now procured weekly, under special arrangements, from London and twenty of the largest cities of the United Kingdom.

The area of the Weekly Tables has been extended as their utility in recent epidemics has become evident; so that by persevering application, the authorities have been induced to furnish returns similar to those of London, though less complete, from Paris, Rome, Berlin, Vienna, in Europe; from Bombay, Madras, and Calcutta in Asia; and from New York in America. The sanitary state of a large portion of the population of the civilized world is thus reflected; and immediate intimation is given of any epidemic arising in the horizon, even when the cloud is no bigger than a man's hand.

The thousand millions of people in the world are in many ways bound together, simply because they are of the same species, and have wants in common, which are satisfied by the interchange of the productions of various climes through commerce. But they have this still more intimate element of solidarity, that from physical sympathy they are affected by each other's health and sicknesses. A man dies of cholera in the valley of the Ganges, and the disease there generated, like a consuming fire, visits Europe, Africa, and America; a child in Arabia has small-pox, and the disease of this child spreads and exterminates tribes of North American Indians; the plague, born in Egypt or Ethiopia, prostrates the population of the Roman Empire, and sweeps away at intervals through centuries a large proportion of the populations of Athens, Florence, London, and other large cities.

The solidarity here appears to be an evil, inasmuch as it visits on all, the sanitary sins of a few; but in reality the punishment is so graduated as to pass lightly over the heads of nations which have complied with the

* Reprinted from the "Annual Summary for 1871."

conditions of human existence. and only to destroy utterly the cities which wallow in impurities, and by ignorance, negligence, or wilfulness, violate the laws of healthy life. But there is on the other hand this compensating element; the discovery of the laws of public health, the determination of the conditions of cleanliness, manners, water supply, food, exercise, isolation, medicine, most favourable to life in one city, in one country, is a boon to every city and to every country, for all can profit by the experience of one; a hygienic truth once established by facts, becomes as general in its application as a truth in chemistry.

The class of zymotic diseases deserves especial attention; they give rise to all the epidemics, and may be popularly explained on the assumption that their phenomena are the effect of changes in man and in the higher animals, wrought by the invasion of self-multiplying molecules of the lowest, simplest forms of life, having this in common with the highest forms, that they succeed each other in generations, with the marvellous variations of number so commonly observed in vegetable blights, fungi, flies, locusts, and parasites. The precautions commonly adopted, have had in view the isolation of the sick, which in the cases of leprosy, hydrophobia, and syphilis, where the zymotic matter is fixed in a solid or fluid, proves effectual at least, in restraining the disease within narrower limits than it would otherwise attain. Few people contest the propriety of isolating lepers, as it was done under the Mosaic law; neither is it considered an evil to shut up dogs in times when hydrophobia is common; but a large party in the country disputes, on various grounds, the policy of restraining women from sowing syphilis through the land, and insists on reversing the policy now in operation, which is certainly calculated to diminish the chances of its extension among all classes of people, including an indeterminate number of children. The question may be looked at from a moral, as well as a physical point of view; but it is evident that either man or woman who goes on communicating a disease so injurious as syphilis is to the human race is a living nuisance, to be suppressed by the laws in the mildest way, but to be suppressed at any reasonable cost. In London the deaths from syphilis are imperfectly reported, as they are often referred to secondary diseases; but the same system of reporting which showed a rapid increase from 288 in the year 1859 to 473, 466, and 463 in the years 1868-70, showed a decline to 356 in the year 1871.

Another method of limiting the diffusion of disease is illustrated by vaccination, where the milder form of disease protects the system to a great extent against the danger of future attacks of small-pox. In spite of the compulsory vaccination Act, this disease was epidemic in 1871, and in London alone killed 7876 persons. Several of these persons had been vaccinated; but the great bulk of them had never been vaccinated at all, and certainly had never had the true cow-pox. The Act was imperfect from the first, the work was in itself difficult, and its administration was not at all calculated to overcome the opposition to its operation. The result is the signal failure here proved by 13,174 deaths from small-pox in the year 1871 among the population of 17 large English towns.

The other zymotic diseases, as is often the case, were less active in the year; the great epidemic of scarlet fever, so fatal in the two previous years, subsided, and in 1871 was fatal, in the 17 largest English towns, to 4253 persons. In hygienic matters it is right to take precautions against the entrance into a city of zymotic diseases of any form; but, as in the case of vaccination, it is not sufficient to stop disease of one kind while the causes of diseases of all kinds abound in air, water, soil, house, food; it is necessary to take the whole condition of the city into account, and to leave none of those causes in operation by which health is destroyed, life embittered, and generations debased. This can be done under a simple practical sanitary code.

Large Towns of the United Kingdom.—During the 52 weeks of 1871, among the rather more than seven millions of people living in London and the 19 other large cities of the United Kingdom furnishing Weekly Returns, the birth-rate was equal to 36 per 1000, and the death-rate to 27. The birth-rate differed but slightly from that in the previous year, while the death-rate showed an increase of 2 per 1000. In Dublin the rate was 26, in Edinburgh 27, while in Glasgow it was so high as 33, which among the English towns was only exceeded by the rates in Liverpool and Sunderland. The Census enumeration in April 1871 showed that the population of Edinburgh had been considerably under-estimated in recent years, while it had been overstated in Dublin. In Dublin the population was all but stationary during the ten years 1861–71.

English Large Towns.—In 17 of the largest English towns, and in 50 other large town districts, it is estimated, from the numbers enumerated in April 1871, that 8,728,324 persons were living at the middle of that year, among whom 316,891 births, and 226,935 deaths were registered during the year, the birth-rate being equal to 36, and the death-rate to 26 per 1000; in the 17 largest towns the death-rate was 26·5, while in the 50 towns ranking next in size it did not exceed 24·8. In the population of England and Wales, exclusive of these 67 towns, the death-rate was 21 per 1000. This difference occurred principally in the death-rate from the seven principal zymotic diseases, which was 6·5 in the 17 largest towns, 5·3 in the 50 other towns, and 3·4 in the rest of England and Wales; among the 50 towns small-pox was only severely epidemic in Southampton, South Shields, and Gateshead, while in the 47 others the death-rate from the principal zymotic diseases ranged from 1·8 and 2·1 per 1000 in Cheltenham and Exeter, to 8·3 in both Wigan and Stoke-upon-Trent. The death-rate from all causes in these 50 towns was under 20 per 1000 in Dover, Chatham, and Cheltenham; while it exceeded 30 per 1000 in Stoke-upon-Trent, Preston, South Shields, and Gateshead.

In the 17 largest English towns furnishing Weekly Returns, and including London, the birth-rate was 36·2 per 1000, and ranged from 33 in Nottingham and 34 in Norwich, to 41 each in Sunderland, Salford, and Leicester. The death-rate averaged 26·5 per 1000; it did not exceed 19 in Portsmouth and 23 in Hull and Bristol, while it was 31 in Manchester, 32 in Newcastle, 35 in Liverpool, and 37 in Sunderland. The small-pox epidemic was the principal cause of the excess in the three latter towns. Influenced partly by the seasons, and partly by the varying fatality from the small-pox epidemic, the annual rate of mortality from all causes in the 17 towns was 28 in the first, 24 in the second, 26 in the third, and 27 in the fourth quarters of the year; the highest annual rate was 34 in the 50th week of the year, and the lowest 21 in the 27th week, or the beginning of July. The weekly deaths from small-pox in these 17 towns, which were 133 in the first week of the year, rose to 370 in the fifth week of the second quarter, and were 371 in the last week of June; the weekly numbers declined during the third quarter to 120 in the second week of September; during the last quarter of the year they rose again steadily, and averaged 287 in the last three weeks of December. In the first quarter of the year the small-pox epidemic in these 17 largest towns was almost confined to London and Liverpool, in the second quarter it became fatally prevalent in Newcastle and Sunderland, while in the last quarter of the year, Norwich, Wolverhampton, Nottingham, and Sheffield suffered severely from the disease, which was also prevalent to a slighter extent in Manchester and Salford. The 13,174 deaths in the 17 towns referred to small-pox during the year imply a death-rate of 2·1 per 1000 persons living. The death-rate from the seven principal diseases of the zymotic class in these towns, including small-pox, averaged 6·5 per 1000, while in 1870 it was only just below 6 per 1000; it is evident therefore that the greatly increased fatality from

small-pox was nearly balanced by a decline in the deaths from the other diseases. To scarlet fever only 4253 deaths were referred in the 17 towns in 1871, against 11,054 in 1870; and different forms of fever caused but 4857 deaths against 5475. Measles and whooping-cough were slightly more fatal than in 1870. In the several towns the lowest death-rates from these seven diseases were 3·2 in Portsmouth, 3·5 in Bristol, and 4·3 in Hull; and the highest, 8·1 in Salford, 9·3 in Newcastle-upon-Tyne, 11·4 in Liverpool, and 15·5 in Sunderland.

The 164,419 deaths from all causes in the 17 largest English towns during 1871 included 43,113 or 26·2 per cent. of infants under one year of age, and 29,906 or 18·2 per cent. of persons aged 60 years and upwards; these proportions were almost identical with those which prevailed in the same 17 towns during 1870. Infant mortality, measured by the per-centage of deaths under one year to births registered, averaged 19·2 in the 17 towns, against 18·3 in 1870; in the several towns this per-centage ranged from 14·4 and 16·5 respectively in Portsmouth and Bristol, to 24·1 in Leicester and 26·9 in Liverpool. The proportion of deaths of elderly persons to deaths at all ages in the several towns ranged from 12·7 per cent. in Salford and 13·8 in Sheffield, to 23·6 in Bristol and 25·0 in Norwich.

In the large PUBLIC INSTITUTIONS of the 17 towns no less than 24,261 deaths were recorded in 1871, showing a proportion equal to 14·8 per cent. of the total deaths, against 13·5 in 1870; this increase was in great measure due to the deaths occurring in temporary small-pox hospitals established to meet the exigencies of the epidemic. The per-centage of deaths in public institutions was 18·2 in London and 16·1 in Liverpool, while it was only 5·8 in Bradford and 7·3 in Sheffield. It is somewhat remarkable that notwithstanding the severity of the small-pox epidemic in Sheffield during the last quarter of 1871, resulting in 360 deaths, no special small-pox hospital appears to have been established, and the deaths recorded in the established workhouses and hospitals situated within the borough were actually below the numbers recorded in the first and second quarters of the year.

During the year 9483, or 5·8 per cent., of the deaths were registered in the 17 towns upon the information of the coroner, being inquest cases; in the previous year 8881 inquests were registered, or 5·6 per cent. of the total deaths. The highest proportions of these inquest cases were 6·2 per cent. in London, 6·6 in Manchester, and 9·2 in Birmingham. The deaths referred to different forms of violence in large towns show a constant increase; in the 17 largest English towns 5273 deaths were caused by violence, principally resulting from negligence (which is returned as accidental), against 4082 in 1870. The per-centage of these violent deaths in 1871, which averaged 3·2 in the 17 towns, ranged from 1·9 and 2·2 respectively in Leicester and Salford, to 3·9 in Liverpool and 5·1 in Birmingham. This excess of deaths from violent causes in Birmingham was as conspicuous in 1870 as in 1871.

London.—The number of persons enumerated in April 1871 within the registration district of London, was 3,254,260, while in 1801 it was but 958,863. The revised area is given as 78,080 acres, or 122 square miles; this includes 2718 acres of the Thames. The mean density of population in this area was 42 persons per acre; in 1801 it was only 12, while it successively increased at each Census enumeration to 36 in 1861. In the Central Districts at the last Census the mean density was 150, while it was 107 in the East, 56 in the North, 52 in the West, and only 21 in the South districts which include considerably more than half the entire area of London. Among the 137 registration sub-districts this density ranged from 1 person per acre in Eltham, and 3 each in Lewisham and Dulwich, to 410 and 418 respectively in St. Andrew and White-

cross sub-districts of Holborn, and 429 in Berwick Street sub-district of Westminster.

The decennial increase of population in the whole of London, which had been 21·2 and 18·7 per cent. in the two decades 1841-51 and 1851-61, further declined to 16·1 per cent. between 1861-71. In the central group of districts, including, besides the City, St. Giles, Strand, and Holborn, the population had decreased 12·8 per cent. between 1861 and 1871; while the increase was 11·9 in the East, 21·6 in the North, 22·5 in the West, and 25·2 in the South groups of districts. It is but natural that the increase of population should be largest where the density of population is smallest, that is where there still exists most land still uncovered with buildings. We may therefore fairly expect that the largest increase during the present decade will occur in Hammersmith and Fulham in the West, Hampstead in the North, and in Norwood, Wandsworth, Putney, Streatham, Dulwich, Eltham, Lewisham, and Charlton in the south group of districts. In each of these sub-districts the number of persons enumerated to an acre in 1871 showed that a considerable portion of their area still remains to be built over. The most remarkable case of increase of population between 1861 and 1871 occurred in Battersea sub-district, in which the number of persons rose from 19,600 in 1861 to 54,016 in 1871, the increase being equal to 176 per cent. The largest decrease was shown in Queenhithe sub-district of the City; here the population fell from 8570 in 1861 to 4753 in 1871, a decrease of nearly 45 per cent.; in the sub-district of St. Olave, Southwark, the decrease was equal to 43 per cent.

In London during the year 1871, 112,617 births and 80,430 deaths were registered; the natural increase to the population of the Metropolis by excess of births over deaths was therefore 32,187. The birth-rate was equal to 34·5 per 1000, and was 1·7 per 1000 below the average rate in the 17 largest English towns. The birth-rate varies to a remarkable extent in different sections of the population; this variation is governed by the ages, proportion of the sexes, conjugal condition, and social position of the people. For instance, the birth-rate per 1000 in Christchurch sub-district of the City was but 14, and in St. James's Square 15, while it was 40 in Hoxton Old Town, 41 in Haggerston East, and 44 in St. James, Bermondsey, sub-districts. In the five groups of districts the birth-rate for the year averaged 30 in the West, 34 in the North, 32 in the Central, 39 in the East, and 36 in the South.

The 80,430 deaths in London included 19,244 or 23·9 per cent. of infants under one year of age, and 15,541 or 19·3 per cent. of persons aged 60 years and upwards; these proportions were almost identical with those observed in 1870. Infant mortality measured by the proportion of deaths of infants under one to births registered was 17·1 per cent., or 2·1 lower than the average proportion in the 17 towns. Among the deaths of elderly persons 2807 were registered at 80 years of age and upwards, against 2738 during 1870.

The deaths at all ages in London included 7912 which were referred to small-pox, 1427 to measles, 1902 to scarlet fever, 344 to diphtheria, 2291 to whooping-cough, 1691 to different forms of fever, and 3887 to diarrhoea; in all 19,454 or 24·2 per cent. of the deaths from all causes resulted from these seven principal diseases of the zymotic class, against 16,489 in 1870. The deaths from these causes in 1871 were equal to six per 1000 of the population. The death-rate in the year from small-pox was 2·4 per 1000. The fatal cases of measles differed but slightly from those in the previous year; the weekly numbers were continually below the average during the first three quarters of the year, while a considerable increase was shown in the three months ending December. Scarlet fever which had been fatally epidemic in most parts of the Metropolis during 1869 and 1870, causing 5841 and 6040 deaths respectively, showed a considerably

smaller fatality during 1871 resulting in but 1902 deaths, of which 722 occurred in the first quarter of the year; excepting 1866 and 1867 scarlet fever was less fatal in London in 1871 than in any of the twelve years 1859-70. The 344 deaths from diphtheria corresponded with the number in 1870; the deaths referred to this disease have steadily declined in London since 1861-2-3, previously to which they were not separately classified from scarlet fever. The 2291 deaths from whooping-cough exceeded by 335 those in 1870, while they were 1478 below the number in 1869. Of the 1691 deaths referred to fever, 384 were classified as typhus, 871 as enteric or typhoid, and 436 as simple continued fever. It is a satisfactory sign of the improving sanitary condition of the Metropolis to find that the deaths referred to different forms of fever have steadily declined from 3703 in 1864 to 1691 in 1871. Excepting the year 1868, when the summer heat was so remarkably high, the 3887 deaths referred to diarrhœa, of which 3122 occurred in the third quarter, considerably exceeded the number in any year since 1859.

To different forms of violence 2557 deaths in London were referred during 1871, against 2390 and 2529 in 1869 and 1870; of these, 2144 resulted from negligence or accident, including 924 from fractures and contusions, 266 from burns and scalds, 50 from poison, 285 from drowning, and 498 from suffocation, nearly all cases of infants. During the year 293 cases of suicide, and 107 of murder or manslaughter were registered; nearly all the latter were cases of infanticide. The deaths from fractures and contusions included 228 caused by horses or vehicles in the streets; the numbers of these fatal accidents were 210 in 1869 and 229 in 1870. The deaths from all forms of violence showed a proportion of 3·2 per cent. of the total deaths, corresponding exactly with the average proportion in the 17 largest English towns. The number of violent deaths registered in London is doubtless raised to an appreciable extent by cases of injury occurring in the suburban districts, which are admitted to the London hospitals, and proving fatal are therein registered. Inquests were held on 4968, or 6·2 per cent., of the total deaths in London; in the previous year the inquest cases were 4949.

No less than 14,562 deaths in London, or 18·1 per cent. of the total deaths, were recorded in the large Metropolitan public institutions; of these, 6669 occurred in workhouses, 7422 in hospitals, 314 in lunatic asylums, 81 in naval and military asylums, and 76 in prisons. These deaths in institutions showed an increase of 1937 upon those in 1870, a result principally due to 2718 being recorded in the permanent and temporary small-pox hospitals; of these, 1151 occurred in that at Hampstead, 654 at Stockwell, and 613 at Homerton.

The death-rate from all causes in London was 24·6 per 1000, and higher than in any year since 1866 when cholera was epidemic; exclusive of the deaths from small-pox the rate would have been but 22·2 per 1000. The male death-rate was 26·6, while among females it did not exceed 22·8 per 1000; at the recent Census there were 113·7 females living in London to each 100 males. In the several groups of districts the death-rate of persons was 22·5 in the West, 25·6 in the North, 25·0 in the Central, 26·2 in the East, and 24·1 in the South. The deaths recorded in the public institutions form a most disturbing element in calculating local rates of mortality in the various districts and sub-districts of London; unless the 14,562 deaths in institutions could be correctly distributed among the sub-districts from which the inmates were received the several death-rates could not be satisfactorily ascertained. After distributing these deaths among the five groups of districts, in proportion to those occurring among the normal population of each of the groups, the corrected death-rates per 1000 become 22·8 in the West, 23·8 in the North, 24·4 in the Central, 26·8 in the East, and 25·1 in the South. By comparing these corrected rates with the uncorrected ones quoted above it will be

seen, that the rates in the North and Central groups were unduly raised by an excessive proportion of deaths in institutions, while the rate for the South Districts was under-stated.

Metropolitan Water Supply. The daily supply to London is about 107 millions of gallons; of this according to Dr. Frankland's periodical reports 20 millions is "good wholesome water from wells and springs in the chalk," and 87 millions is "more or less impure water derived from polluted rivers." The Chelsea and Lambeth Companies draw their supplies from the Thames after it has received the polluted Mole, and the sewage of 600,000 people, including the filth of Oxford, Reading, and Windsor. The West Middlesex, Southwark, and Grand Junction Companies draw their water from the Thames above the junction with the Mole, but after it has received the sewage of the three above mentioned towns, as well as of smaller places. The East London Company takes its supply of water from the Lea, below the sewer outfalls of Luton, Hertford, and Ware. The Lea, however, is less polluted than the Thames, and, as Dr. Frankland remarks, it is to be "regretted that the East London Company has just spent about 500,000*l.* in conveying water "from the Thames to their works in the Lea valley." The New River Company draws rather more than half its supply from chalk wells, and the rest from the river Lea above the sewer outfalls of Hertford and Ware, but below those of Luton, Whitwell, and Welwyn. The Kent Company is the only one of the Metropolitan Companies which draws its entire supply from chalk wells and does not distribute any water from polluted rivers; "this water is uniformly excellent for drinking and all domestic purposes, but is too hard for washing." The average relative proportions of organic impurities contained in the different companies' water at the several analyses during 1871 may be stated as follows:—Kent 1, New River 2, West Middlesex, East London, and Chelsea each 6, Grand Junction and Lambeth 7, and Southwark and Vauxhall 8. With regard to filtration, the West Middlesex and New River Companies delivered clean and transparent water on all occasions when tested; the Chelsea water was more or less turbid on 5 occasions out of 15, the Southwark on 4 out of 13, the Grand Junction on 4 out of 15, the Lambeth on 7 out of 14, and the East London on 3 out of 13. As the Kent water is drawn entirely from deep chalk wells it is not filtered before delivery, and the natural filtration it receives through the chalk is so superior to the best artificial filtration that this company's water has never for several years past shown any signs of turbidity. The Chelsea and Lambeth Companies, however, "periodically deliver water so muddy as to be entirely unfit, on this "account alone, for domestic use." Living organisms were found during 1871 in most of the turbid samples delivered by each of the Companies drawing their supplies from the Thames, excepting only the West Middlesex which on all occasions sent out well filtered water.

Metropolitan Main Drainage. According to weekly returns furnished by the Engineers of the Metropolitan Board of Works, the average daily quantity of sewage pumped into the river Thames at Crossness was 226,905 tons (=230,545 cubic metres), and at Barking 246,143 tons (=250,092 cubic metres); in 1870 the daily quantities averaged 204,121 and 177,847 tons. The large increase in the amount pumped at Barking was probably due to the progress made in the low level sewer on the north side of the Thames, which was only partially used during the first part of 1870. The influence of the rain-fall upon the amount of sewage pumped does not appear to be very direct; for instance, at Crossness the average daily quantity during the September quarter, when the rain-fall was 8.3 inches, was 234,939 tons (=238,708 cubic metres), while in the December quarter, with a rain-fall of but 3.2 inches, the daily average of sewage was 213,047 tons (=216,465 cubic metres).

Foreign Cities. Weekly returns are received from Paris, Berlin, Vienna, Brussels, Rome, Florence, and Turin; but the continuity of the series in 1871 having been broken, in the case of Paris and Berlin by the war, and in the case of the other cities by interruptions from various causes, a summary for the year cannot be furnished.

The mortality in the Dutch towns was excessive during 1871 owing to a fatal epidemic of small-pox; the death-rate from all causes was equal to 46 per 1000 in Rotterdam, 44 in Utrecht, 41 in the Hague, and 34 in Amsterdam; the small-pox rate was 14 per 1000 in both Rotterdam and the Hague.

In Calcutta the deaths registered during the 52 weeks of 1871 were 10,467, showing a death-rate of 24 per 1000 of the population (430,000 persons) enumerated in 1867; of these 10,467 deaths, 4013 or 38 per cent. were referred to remittent fever. In Madras 13,034 deaths were registered during the 52 weeks of the year, and the death-rate calculated on the population of 427,771, as enumerated in 1863, was 30 per 1000. In Bombay the deaths from all causes (exclusive of still-born) during the same period were 16,008, giving a death-rate of 20 per 1000 of the population 816,562 as enumerated in 1864. Remittent fever was again the most fatal disease, having caused 5442 deaths; small-pox was fatal in 921 cases.

An annual return furnished by Dr. Chas. P. Russel, Registrar of Records to the Health Department of the City of New York, shows that, during the 12 months ending 31st December 1871, 26,976 deaths occurred in that city, giving an annual rate of mortality of 29, the population being estimated at 942,292. These 26,976 deaths included 805 from small-pox, 409 from measles, 791 from scarlet fever, 238 from diphtheria, 465 from whooping-cough, 306 from different forms of fever, and 3653 from cholera and diarrhœa. The total number of deaths from these eight diseases of the zymotic class was 6667, equal to an annual rate of 6 per 1000, corresponding with the death-rate in London during the year from the same eight diseases.

REMARKS on the METEOROLOGY of 1871. By JAMES GLAISHER, Esq.,
F.R.S., &c.

The several meteorological values in 1871 differed but very little from their respective averages. The rain-fall was in excess of that in the previous year, but still in defect of the average of the preceding 23 years, and the mean temperature of the air was also nearly one degree below the average.

The principal meteorological features of 1871 were, the unusually warm temperatures during February and March; the cold inclement weather during May and June; the extremely low temperatures recorded during the early portion of December, and the scarcity of rain during the last quarter of the year.

The annual means of the various elements at the several stations between Guernsey and North Shields are shown in Table 38, pages xciv-xcv.

These results naturally varied considerably at the several stations, but, so far as concerns the excess or deficiency above or below the average, the observations at the Royal Observatory may be taken as generally applicable to the whole country.

Atmospheric pressure. The readings of the barometer oscillated above and below the average several times during the first few days of January, but on the 13th a rapid fall commenced, and reached its minimum 28·73 in. by 9 a.m. of the 16th; a steady increase was recorded after this, and with but few interruptions continued till the end of the month; the range of readings for the month was 1·36 in.

During February the mean daily readings were principally above the average, the range of reading in the month amounting to 1·20 in. In March several oscillations were recorded, the range being nearly the same as in the preceding month. During April, May, and June, the movements were generally small, especially so in May, in which month the maximum was 30·21 in., and the minimum 29·64 in. The changes of atmospheric pressure were small in amount, but frequent, during July, the tendency, however, being towards higher values in the middle than at the beginning and end of the month. The maximum value, 30·06 in. occurred on the 6th, and the minimum 29·24 in. on the 25th, thus giving a range of 0·82 in.

In August the oscillations were larger than in July, the principal movements being an increase to 30·02 in. on the 10th, a decrease to 29·26 in. on the 18th, an increase to 29·80 in. on the 21st, a decrease to 29·56 in. on the 24th, an increase to 30·31 in. on the 28th, and a decrease to 29·82 in. on the 30th. During the next two months the movements were numerous and rapid; on the 1st October the recorded value was 28·9 in.; an increase then set in, and 30·3 in. was reached on the 13th, but during November few movements of the barometric column of any magnitude were experienced. From December 1st to 18th, high values were recorded, the daily means without exception being in excess of the average, but from the latter day to the end of the year there were several movements, a tendency being shown to decrease.

Temperature. The very cold weather at the end of the last quarter of 1870 continued till January 5th, when it somewhat moderated, and a few days of little milder temperatures were experienced. On the 19th the cold weather returned and continued to February 2nd; taking the temperature for the 33 days ending this day, the average deficiency of daily temperature was $3\frac{1}{4}^{\circ}$. From the 3rd February to the 14th March the weather was occasionally spring-like, but from the latter date to the end of the quarter very changeable, the temperatures being for periods of two

or three days considerably in excess, and then again for similar brief periods considerably in defect of the average. With the exception of the period comprised between April 9th and 12th, the temperatures were almost continuously below the average (on some days to large amounts) throughout the quarter ending June 30th. The average daily excess of temperature during the exceptional period above-mentioned was 4° , and the average daily deficiency for the remaining 73 days exceeded $2\frac{1}{2}^{\circ}$. The direction of the wind from April 12th to 29th was generally S.W., and during the rest of the quarter generally E. or N., or a compound of these directions. The low temperature was the most severe at the beginning and end of June, and the deficiency of temperature for this month from the average of the preceding 30 years exceeded 4° daily. The month of June 1860 was of the same low temperature, but previous to that we must go back as far as the year 1821 for one of lower temperature. The cold weather continued with slight exceptions till August 5th. This was followed by a period of 42 days of warm and genial weather, extending from August 6th to September 16th, during which interval the mean excess of temperature above the average was $4\frac{1}{2}^{\circ}$ daily.

From this time to the end of September the weather was again cold, and heavy rain fell everywhere.

During October constant alternations of warm and cold temperatures were experienced, but during November and to the 12th December a period of cold weather was prevalent. The mean temperature of November was $37^{\circ}\cdot 6$; in the period 1771-1870 there have been but two years when a lower value than this has been recorded, viz., 1782, $34^{\circ}\cdot 7$, and 1786, $36^{\circ}\cdot 7$. The mean defect for the first 12 days of December was no less than $9\frac{1}{4}^{\circ}$, the mean departure for the 7th, 8th, and 9th exceeded 14° , that for the 8th being as large as $19^{\circ}\cdot 3$.

(The cold was more severely felt in Norfolk than elsewhere; the minima at Holkham, Norwich, and Somerleyton being respectively $7^{\circ}\cdot 6$, 9° , and $9^{\circ}\cdot 7$; the temperatures were not particularly low at Guernsey, in Cornwall, near the West Coast, nor in Northumberland; but the cold was generally intense at a short distance inland from the south coast, and throughout the Midland Counties).

From the 13th December to the end of the year the temperature was in excess to the average amount of $3\frac{1}{2}^{\circ}$ daily.

Rain-fall. The fall of rain or snow was somewhat large in January, being two tenths of an inch above the average, but in both February and March it was half an inch in defect. The amounts collected during April, and June were respectively 1·3 in. and 1·1 in. in excess of the average fall, but in May 1·3 in. in defect. In July and August light falls were generally experienced, but in September heavy rain fell everywhere, the amount measured being rather more than 4 inches. The fall in October was only one half its average, in November one fourth, and in December three fifths.

The rain-fall of the year at the Royal Observatory amounted to 22·3 in., which was 1·6 in. below the average of 23 years, but 3·8 in. excess of the fall of the previous year.

At the several observation stations furnishing reports, the rain-fall of the year varied from 20·1 in. at Royston, and 20·8 in. at Cardington, to 43·4 in. at Stonyhurst and Allenheads, and 41·6 in. at Helston. Rain fell on 132 days at Cardington, and on 272 days at Stonyhurst. At the Royal Observatory rain was measured on 162 days.

PRELIMINARY TABLES.

TABLE 1.—Estimated Population, and Number of Marriages, Births, and Deaths registered in England in each of the Thirty-four Years 1838-71.

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of each Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS	EXCESS OF BIRTHS OVER DEATHS.
1838	15,387,609	118,067	306,124	463,787	343,760	120,027
1839	15,514,255	128,108	346,323	492,374	338,964	153,410
1840	15,730,813	122,965	345,380	502,308	359,687	142,621
1841	15,929,493	122,496	344,393	512,198	343,347	168,851
1842	16,120,236	118,825	337,360	517,739	349,519	168,220
1843	16,332,226	128,818	347,636	537,225	346,445	190,780
1844	16,535,174	122,349	364,498	540,768	356,983	183,785
1845	16,739,126	142,748	397,486	543,331	349,206	194,125
1846	16,944,093	145,064	391,226	572,626	390,215	182,411
1847	17,150,018	135,945	371,690	539,965	422,304	117,661
1848	17,356,923	128,200	376,460	563,029	399,228	163,801
1849	17,564,836	141,893	398,706	578,129	440,239	137,890
1850	17,773,224	122,744	395,486	596,423	398,966	197,457
1851	17,982,549	154,206	398,412	615,965	395,296	220,669
1852	18,192,206	158,722	317,564	634,012	407,125	226,887
1853	18,404,268	164,220	329,040	612,291	421,097	191,194
1854	18,616,810	159,727	319,454	634,405	437,905	196,500
1855	18,829,000	152,112	304,226	655,048	425,708	229,340
1856	19,042,412	129,287	318,674	657,453	399,206	258,247
1857	19,256,516	129,097	312,124	663,071	419,215	243,856
1858	19,471,291	156,070	312,140	655,481	449,226	206,255
1859	19,686,701	167,722	285,446	689,221	440,721	248,500
1860	19,902,712	170,126	340,212	684,048	422,721	261,327
1861	20,119,214	162,706	327,412	696,406	425,114	271,292

Mean - -	16·5	33·8	22·4	61	30	45

NOTE.—The Table may be read thus:—In the year 1836 to every 10,000 persons living there were 154 persons married, 303 births, and 224 deaths; the number of persons living to every person married, birth or death, was 65, 33, and 45 respectively. The rates in this Table have been calculated upon the estimated populations given in Table 1, but no corrections have been made for the difference between an ordinary year of 365 days and leap year.

TABLE 3.—Marriages in England in each of the Thirty-one Years 1841-71; those solemnized according to, and not according to, the Rites of the Established Church; with other details respecting the Marriages in the Churches of the Established Church.

Mean Annual Rate per 1000 in each quarter	-	-	-	-	13·7	16·3	15·3	19·5

Note.—The three months January, February, and March contain 90 days, and in leap year 91 days; the three months April, May, and June 91 days; and each of the two last quarters of the year 92 days. For this inequality a correction has been made in the above calculations.

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living, there were 134 persons married.

TABLE 7.—Proportional Number of Persons Married in the several Counties of England during the Year 1871; of Persons who signed the Register with Marks; of Persons not of full Age; and of Re-marriages.

Mean Annual Rate per 1,000 in each Quarter	-	-	-	-	32·4	32·1	32·5	32·2

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living there were 308 births registered. In the calculation of these rates a correction has been made for the varying number of days in the different quarters, see note to Table 6.

TABLE 13.—Proportional Number of Births in England in each Quarter to 1000 Births in the Average Quarter* of each of the Thirty-four Years 1838-71.

YEARS.	NUMBER OF BIRTHS IN THE AVERAGE QUARTER.	PROPORTIONAL NUMBER OF BIRTHS.				
		In the AVERAGE QUARTER (assumed to be 1000).	FIRST QUARTER ending March 31.	SECOND QUARTER ending June 30.	THIRD QUARTER ending Sept. 30.	FOURTH QUARTER ending Dec. 31.

1871 -	11,093,122	11,689,629	23·9	21·8	107	112
Average proportion in 34 years, 1836-71 - -			23·3	21·5	104	109

The Table may be read thus:—In the year 1836 to every 1000 males living there were 23·4 deaths; to every 1000 females living there were 21·5 deaths; and to each 100 females who died there were 106 deaths of males. The last column shows the relative mortality of males and females; and that out of equal numbers living the deaths of males were as 106 to every 100 deaths of females in 1836.

MEANS OF 5 YEARS.													
(3 Years.) 1838-40	23'3	72'3	9'6	5'2	8'4	10'2	13'0	18'5	22'5	67'6	144'1	308'3	438'3
(5 Years.) 1841-45	22'2	69'0	8'9	4'9	7'8	9'4	12'1	17'4	20'4	65'3	143'8	299'1	431'8
1846-50	24'1	74'1	9'6	5'4	8'6	10'5	13'4	19'4	23'4	68'9	143'9	312'2	449'3
1851-55	23'6	74'2	8'8	5'2	8'1	9'9	12'9	18'6	21'5	66'8	150'8	305'0	449'6
1856-60	23'7	71'9	8'3	4'6	7'4	9'2	12'4	17'1	20'0	66'2	143'7	301'2	434'6
1861-65	23'7	74'0	8'5	4'7	7'8	9'7	13'4	18'8	22'6	66'6	145'7	312'4	445'1
1866-70	23'7	73'0	7'9	4'3	7'1	10'1	13'6	19'6	23'5	68'2	148'7	308'8	419'0

Note.—The Table may thus be read:—Of each 1000 male children living under five years of age, 72'6 died in the 34 years 1838-71; in the five years 1841-45 this proportion averaged 69'0 per 1000; and in the five years 1866-70 it was 73'0.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (see Table 66, p. cxiv.), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

Note.—The Table may thus be read:—Of each 1000 female children living under five years of age, 63·7 died in the 34 years 1838-71; in the five years 1841-45 this proportion averaged 56·8 per 1000; and in the five years 1866-70 it was 63·4.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (see Table 66, p. cxiv.), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

TABLE 22.—ENGLAND.—Annual Rates of Mortality per 1000 of Females at different Ages in each of the Thirty-four Years 1838-71.*

Average Number living to One Death annually (1840-71)	41	44	44	40	38	41

NOTE.—The populations upon which these rates of mortality have been calculated are deduced from the numbers enumerated at the four Censuses of 1841, 1851, 1861, and 1871. The deaths used are those registered in the complete years.

Certain alterations affecting the West and Central groups of districts were made in the year 1868, but corrections have not been made in the results given in this Table for years prior to 1861.

NOTE.—The numbers for 1837 were registered in the half year ending 31st December.

TABLE 42.—Area, estimated Population, and Marriages, Births, and Deaths in the United Kingdom, in the Year 1871.

—	AREA IN STATUTE ACRES.	AREA IN HECTARES.	Estimated POPULATION in the middle of the Year 1871.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
	UNITED KINGDOM	77,635,182	31,416,707	31,541,347	239,000	518,120	1,102,233
Great Britain - -	66,815,353	22,391,326	26,150,734	214,078	428,156	913,555	589,323
England and Wales -	37,319,221	15,102,007	22,782,812	190,112	380,224	797,428	514,879
Scotland - - -	19,496,132	7,889,519	3,367,922	23,966	47,932	116,127	74,644
Ireland + - -	20,819,829	8,425,181	5,390,613	44,952*	89,964*	188,078*	121,825*

* The registered Marriages, Births, and Deaths for Ireland were 28,900, 151,665, and 88,720 respectively. By the authority of the Registrar General of Ireland these numbers have been corrected in the above table for defective registration. It has been assumed that the marriages, births, and deaths in Ireland in the year 1871 were in the same proportion to population as the marriages, births, and deaths in England and Wales.

TABLE 43.—Proportion per 1000 of Marriages, Births, and Deaths to the Population of the United Kingdom, in the Year 1871.

—	ACRES TO A PERSON.	HECTARES TO A PERSON.	TO 1000 PERSONS LIVING.			
			MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM - -	2'46	'990	8'21	16'4	35'0	22'6
Great Britain - - -	2'17	'879	8'19	16'4	34'9	22'5
England and Wales - -	1'64	'663	8'34	16'7	35'0	22'6
Scotland - - - - -	5'79	2'343	7'12	14'2	34'5	22'2
Ireland - - - - -	3'86	1'563	8'34*	16'7*	35'0*	22'6*

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

* The deaths in Ireland are not all registered; but by the estimate of the Registrar General of Ireland the rate of mortality is nearly the same as that of England. The same may be said of natality.

TABLE 44.—Population, Area, Births, and Deaths in the Islands in the British Seas in the Twenty-one Years 1851-1871.

TOTAL	1,424,442	4,671,515	1,000,650	169,465	7,266,072
Average annual emigration from the United Kingdom		From 1815 to 1871		-	127,475
		For the 10 years ending 1871		-	212,824

* The Customs returns do not distinguish the emigration to Australia during these 10 years, but it appears from other sources that the emigrants who went to this country were in 1821, 320; in 1822, 875; in 1823, 543; in 1824, 780; and in 1825, 458 persons. These numbers are not included in the totals of this Table.

TABLE 46.—Emigration in 1871.

DESTINATION.	AGE, SEX, &c. OF EMIGRANTS EMBARKED.										TOTAL.	NATIVE COUNTRY OF EMIGRANTS.

* The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 184 in 1866, 97 in 1867, 81 in 1868, 61 in 1869, 27 in 1870, and 24 in 1871. The number is 1,647 in sixteen years, which, if added to the 8,893 above, makes 10,540, the total number of deaths of British subjects at sea in 1856-71, exclusive of those of merchant seamen. The Entries in the "Marine Register" of Births occurring in 1871 were but 89, and of Deaths 204.

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen. Since 1867 the return includes seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a seaman die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a passenger die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

TABLE 58.—RETURN of the AGES, RATING, and CAUSES of DEATHS of 4338 Seamen reported to the BOARD OF TRADE as having died in the **British Merchant Service** in the Year 1871. (*Parliamentary Return, No. 169, Session of 1872.*)

1871	22,783,212	—	—	24,743,874

* M. LEGOYT, late director of the Statistical Department of France, favoured the Registrar General with the returns for France for the years 1858-61 and for the year 1866. The population in the four years 1863-65, and in the years 1867-69 was estimated by means of the average annual rate observed between the two enumerations of 1861 and 1866. The estimate for 1870 has been supplied by the French Government.

† The Registrar-General has, from time to time, been indebted to the Chief of the Statistical Department of Austria for the figures relating to that empire. The population returned above includes Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; after 1863 the population of those parts of the empire is excluded. Until 1864 the States of Italy were included; since 1864 they are excluded. The apparent decrease in the population between 1868 and 1869, is due to a change in the boundaries of the Empire of Austria and the kingdom of Hungary.

‡ The population of Schleswig-Holstein, Hanover, Hesse, and Nassau is included in and after the year 1867.

* The returns for France since the year 1860 include the three newly annexed departments. The deaths of France and the number of marriages, births, and deaths for the commune in which was their last domicile. M. Legoyt revises the returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; since 1864, however, they are excluded from the statistics of the empire. Until 1864 the States of Italy were included; since 1864, however, they are excluded from the statistics of Prussia include Schleswig, Hanover, Hesse, and Nassau since 1867. The marriages and births are for Prussia only; the deaths for 1860, 1870, and 1871 include the military that fell in the wars.

† The returns for France in 1863 and 1866.—(M. Legoyt.)

‡ Cholera was prevalent in France in 1865 and 1866.—(M. Legoyt.)

§ Cholera was attributed the excessive mortality in the year 1866 to cholera and the war.

1871	—	—	—	—	—	—	—	—	—

* The decrease of marriages in 1866 may be attributed to the law which then came into operation removing the civil registration from the parochial authorities to the communes; there had been a marked increase in the previous year resulting from a wish to evade the law about to come into operation. Doubtless many of the marriages solemnized in the churches during 1863 escaped registration.

† The figures for 1870 were supplied by Signore L. Bodio, chief of the Statistical Department in Italy.

1871	—	—	—	—	—	—	—	—	—

NOTE.—The Population enumerated at the Census of 1860 was 15,673,536. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. This method of estimating the population is sanctioned by the Junta General de Estadística at Madrid. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

TABLE 64.

POPULATION OF THE UNITED KINGDOM,

(including ISLANDS in the BRITISH SEAS)

with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of the Census Years.	PERSONS.	MALES.	FEMALES.
1801 -	16,302,410	8,096,082	8,206,328
1811 -	18,532,522	9,194,348	9,338,174
1821 -	21,300,573	10,519,256	10,781,317

1841 -	27,077,095	13,325,889	13,751,206
1851 -	27,764,034	13,656,998	14,107,036
1861 -	29,358,927	14,397,427	14,961,500
1871 -	31,914,985	15,622,725	16,292,260

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, the proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

[The above numbers have been deduced by adding to the population of the United Kingdom, as given in Table 62, the enumerated population of the islands in the British Seas, and the Army, Navy, and Merchant Service abroad (see p. vii. of Vol. I. Census of England and Wales, 1871.)]

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the

† These figures have been furnished to the Registrar General by the Ordnance Survey Department, and will be found to differ in many instances from those previously published in the Annual Reports. They do not include, as heretofore, space occupied by freshore or tidal water of rivers and creeks.

‡ As enumerated in April 1871 and revised at the Census

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1871.

Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. This column also includes 59 cases of marriage after divorce, viz., 23 divorced

men who married spinners, 19 bachelors who married divorced women, 1 divorced man who married a widow, and 7 widowers who married divorced women. For the districts in which these marriages took place, see Table 9, p. lxviii, of Report.

* The Districts, which are arranged according to their local position, are collections of contiguous Parishes or Places, generally identical with the Poor Law Unions of the same names.

† As several districts have been amalgamated and new districts have been formed since the numerical arrangement 1 to 635, was adopted, the Districts have this year been re-numbered consecutively from 1 to 637.

† The district of Kingston, which previously to 1st January 1871 was included in the Registration County of Radnor, South Wales, has since that date been included in the Registration County of Hereford, and is now numbered 348.

‡ The details of the alteration in the limits of the district of Wrexham on 1st August 1871 are stated in Table 67, page cxvi; the figures above, for the whole year, relate to the district as at present constituted.

§ The present number of Superintendent Registrars' districts is 626. The above numerical arrangement 1 to 627 was adopted on 1st January 1871; the number has been reduced by one by the incorporation of Shrewsbury, No. 352, with Atoham, No. 351, on 1st October 1871.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† These figures have been furnished to the Registrar General by the Ordnance Survey Department, and will be found to differ in many instances from those previously published in the Annual Reports. They do not include, as heretofore, space occupied by forebore or tidal water of rivers and creeks.

‡ As enumerated in 1871 and revised at the Census Office.

§ Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1871—continued.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are generally identical with the Poor Law Unions of the same names; they are arranged according to their local position under the Registration Counties. The presence of institutions in any District is indicated in this column of the Table by H for Hospital or Infirmary, L for Lunatic Asylum, and W for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District.

† As several districts have been amalgamated and new districts have been formed since the numerical arrangement, 1 to 625, was adopted, the districts have this year been re-numbered consecutively from 1 to 626.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

III.—SOUTH MIDLAND COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1871.—DISTRICTS.—continued.

Table with columns: DISTRICTS, AREA in Statute Acres, POPULATION, 1871, MARRIAGES, BIRTHS, DEATHS, and DEATHS. Sub-sections include 7.-HERTFORDSHIRE, 8.-BUCKINGHAMSHIRE, 9.-OXFORDSHIRE, 10.-NORTHAMPTONSHIRE, 11.-HUNTINGDONSHIRE, and 12.-BEDFORDSHIRE.

IV.—EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1871.—DISTRICTS.

Table with columns: DISTRICTS, AREA in Statute Acres, POPULATION, 1871, MARRIAGES, BIRTHS, DEATHS, and DEATHS. Sub-section includes 13.—CAMBRIDGESHIRE.

V.—SOUTH WESTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1871.—DISTRICTS.—continued.

Table with columns: No., DISTRICTS., AREA in Square Acres., POPULATION, 1871., MARRIAGES., BIRTHS., DEATHS., TOTAL (Males, Females), BIRTHS (Including Illegitimate Births, Illegitimate Births), DEATHS (Males, Females), EXCESS of Births over Deaths. Rows include districts like 19-DEVONSHIRE, 20-CORNWALL, 21-SOMERSETSHIRE.

VI.—WEST MIDLAND COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1871.—DISTRICTS.

Table with columns: No., DISTRICTS., AREA in Square Acres., POPULATION, 1871., MARRIAGES., BIRTHS., DEATHS., TOTAL (Males, Females), BIRTHS (Including Illegitimate Births, Illegitimate Births), DEATHS (Males, Females), EXCESS of Births over Deaths. Rows include districts like 22-GLOUCESTERSHIRE, 23-WARWICKSHIRE, 24-SHROPSHIRE.

* Included in the Registration County of Radnor, South Wales, previously to 1st January 1871.
† The district of Shrewsbury, comprising the sub-districts of St. Mary and St. Chad, was incorporated with Atherton on 1st Oct. 1871.

* The district of Kingston, which previously to 1st January 1871 was counted as belonging to the Registration County of Radnor, South Wales, has since that date been included in the Registration County of Hereford, and is now numbered 345.
 † The details of the alteration in the limits of the district of Wrexham in 1871 are stated in Table 67, page cvii.
 ‡ See note 1, page 34.

* Sub-districts are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; W indicates that a Workhouse belonging to another District or Union is included; H indicates Hospital or Infirmary; and L Lunatic Asylum.

† Wherever the minus sign (-) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1871 are given on pages 29-117.

* The district of Kington was included in the Registration County of Shropshire, previously to 1st January 1871.

† The sub-districts of St. Mary and St. Chad, which formed the district of Shrewsbury previously to 1st October 1871, were on that date annexed, without change in their limits, to Atcham.

DEATHS IN PUBLIC INSTITUTIONS, 1871.

THE FOLLOWING PAGES contain the numbers of deaths registered during 1871 in most of the public institutions of England, with the numbers of special inmates enumerated therein at the Census taken in April of that year. These figures afford the means of correcting the mortality of sub-districts and districts where affected by the situation therein of these institutions, through the deaths recorded in them. Workhouses, hospitals, infirmaries, and public lunatic asylums are included, while prisons, almshouses, schools, as well as small private lunatic asylums and benevolent asylums, are generally excluded. The list includes 1,135 institutions; of which 707 are workhouses, workhouse infirmaries, or workhouse schools; 346 hospitals or infirmaries; and 82 lunatic asylums, mostly public county asylums. These institutions exceeded by 101 those included in the list for 1870, of which increase 17 were workhouse establishments, 80 hospitals or infirmaries, and 4 lunatic asylums. The large increase in the number of hospitals was in great measure due to the establishment of many temporary small-pox hospitals during the prevalence of the epidemic of that disease.

Deaths registered in the principal Public Institutions of England in the Year 1871.

* Three deaths were registered in the "Brilington House" private lunatic asylum, situated in this sub-district.
 † This Institution is situated partly in Somersetshire and partly in Gloucestershire; as an Institution it is counted as belonging to the latter county, in which the larger portion stands; the deaths, however, are referred to the county in which they actually occurred.
 ‡ Two deaths were registered in the "Longwood House" private lunatic asylum, situated in this sub-district.
 § Twelve deaths were registered in the "Barnwood House" hospital for the insane (private) situated in this sub-district.

Special Inmates and Deaths registered in the principal Public Institutions of England in the Year 1871—continued.

NOTE.—The Table may be read thus:—Of the 265,563 deaths of Males, 69,699 were those of children under 1 year of age; 20,832 those of the age 1 and under 2 years; 11,206 of the age 5 and under 10 years; 6851 of the age 15 and under 20 years, and so on.
 * This column includes the deaths of 25 males registered as aged 100 years and upwards; namely, 9 aged 100, 6 aged 101, 2 aged 102, 2 aged 103, 1 aged 105, 1 aged 106, 1 aged 107, and 1 aged 108. The districts in which these deaths occurred and the cause of death in each case are stated in Table 15, page LXVII, of Report.

† The Causes of Death in England and in London, in combination with the Ages at Death, are given at pp. 164-169.

L-LONDON.—DEATHS at different Ages Registered in the Year 1871—in DISTRICTS.

Table with columns: DISTRICTS, TOTAL BURIALS, TOTAL DEATHS, AGES AT DEATH (Under 1 Year, 1, 2, 3, 4, 5 Years, 5-10, 10-15, 15-20, 20-25, 25-30, 30-35, 35-40, 40-45, 45-50, 50-55, 55-60, 60-65, 65-70, 70-75, 75-80, 80-85, 85-90, 90-95, 95-100). Rows include MIDDLESEX (part of), SURREY (part of), and KENT (part of) districts.

II.—SOUTH EASTERN COUNTIES.

Table with columns: DISTRICTS, TOTAL BURIALS, TOTAL DEATHS, AGES AT DEATH (Under 1 Year, 1, 2, 3, 4, 5 Years, 5-10, 10-15, 15-20, 20-25, 25-30, 30-35, 35-40, 40-45, 45-50, 50-55, 55-60, 60-65, 65-70, 70-75, 75-80, 80-85, 85-90, 90-95, 95-100). Rows include 1.—SURREY (extra-met.) and 2.—KENT (extra-metrop.) districts.

* The districts have this year been re-numbered consecutively from 1 to 637.

I.—LONDON.—DEATHS at different Ages Registered in the Year 1871—in Districts.

Table I: DEATHS at different Ages Registered in the Year 1871—in Districts. This table is divided into sections for MIDDLESEX (part of), SURREY (part of), and KENT (part of). Each section lists various districts and provides a breakdown of deaths by age group (Under 5, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, and 95 upwards) and totals for births and deaths. The columns are: DISTRICTS., TOTAL BIRTHS., TOTAL DEATHS., Under 5 Years., 5-10., 10-15., 15-20., 20-25., 25-35., 35-45., 45-55., 55-65., 65-75., 75-85., 85-95., 95 upwards.

II.—SOUTH EASTERN COUNTIES.

Table II: SOUTH EASTERN COUNTIES. This table is divided into two sections: 1.—SURREY (extra-met.) and 2.—KENT (extra-metrop.). Each section lists districts and provides a breakdown of deaths by age group and totals for births and deaths. The columns are: DISTRICTS., TOTAL BIRTHS., TOTAL DEATHS., Under 5 Years., 5-10., 10-15., 15-20., 20-25., 25-35., 35-45., 45-55., 55-65., 65-75., 75-85., 85-95., 95 upwards.

* See note * on opposite page.

IV.—EASTERN COUNTIES.—DEATHS at different Ages, 1871.—DISTRICTS—continued.

Table for Eastern Counties Districts (Norfolk) showing total births, total deaths, and deaths at various ages (1 to 65+) for each district from 1870 to 1871. Districts include Yarmouth, Flegg, Smallburgh, Eppingham, Aylsham, St. Faiths, Norwich, Forehoe, Hensstead, Blofield, Loddon, Depwade, Gutfcross, Waltham, Mifford, Walsingham, Docketing, Fressingfield, Kings Lynn, Downham, Saffron Walden, and Thetford.

V.—SOUTH WESTERN COUNTIES.

Table for South Western Counties showing total births, total deaths, and deaths at various ages (1 to 65+) for each district from 1870 to 1871. Districts include Highworth, Cricklade, Malmsbury, Chippenham, Calve, Marlborough, Devizes, Melksham, Bradford-on-Avon, Westbury, Wootton Bassett, Pewsey, Amesbury, Aldersbury, Salisbury, Wilton, Tisbury, and Mene. The table continues with Dorsetshire districts (Shaftesbury, Sturminster, Blandford, Wimborne, Poole, Wareham, Weymouth, Dorchester, Bournemouth, Bournemouth, Bournemouth, Bournemouth, Bridport) and Devonshire districts (Axminster, Honiton, St. Thomas, Exeter, Newton Abbot, Totnes, Kingsbridge, Plympton St. Mary, Plymouth, East Stonehouse, Stoke Damerel, Tavistock, Okehampton, Crediton, Tiverton, South Molton, Barnstaple, Torrington, Hildford, Holworthy). It concludes with Cornwall districts (Stratton, Camelford, Launceston, St. Germans, Liskeard, Bodmin, St. Columb).

IV.—EASTERN COUNTIES.—DEATHS at different Ages, 1871.—DISTRICTS—continued.

Table for Eastern Counties Districts. Includes columns for Districts, Total Births, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85 & upwards). Districts include 16-NORFOLK.

V.—SOUTH WESTERN COUNTIES.

Table for South Western Counties Districts. Includes columns for Districts, Total Births, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85 & upwards). Districts include 17-WILTSHIRE, 18-DORSETSHIRE, 19-DEVONSHIRE, 20-CORNWALL.

V.—SOUTH WESTERN COUNTIES.—DEATHS at different Ages, 1871.—DISTRICTS—continued.

Table with columns: DISTRICTS, TOTAL DISTRICT, TOTAL DEATHS, and AGES AT DEATH (Under 1 Year, 1, 2, 3, 4, Under 5 Years, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85 & upwards).

VI.—WEST MIDLAND COUNTIES.

Table with columns: DISTRICTS, TOTAL DISTRICT, TOTAL DEATHS, and AGES AT DEATH (Under 1 Year, 1, 2, 3, 4, Under 5 Years, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85 & upwards).

* See note (*) on opposite page.

† See note (†) on opposite page.

VIII.—NORTH WESTERN COUNTIES.—DEATHS at different Ages, 1871.—DISTRICTS.

Table with columns: DISTRICTS, TOTAL BIRTHS, TOTAL DEATHS, and AGES AT DEATH (Under 1 Year, 1, 2, 3, 4, 5, 6-10, 15, 20, 25, 35, 45, 55, 65, 75, 85, 90+).

IX.—YORKSHIRE.

Table with columns: DISTRICTS (e.g., 35.—WEST RIDING, 36.—EAST RIDING (WITH YORK)), TOTAL BIRTHS, TOTAL DEATHS, and AGES AT DEATH (Under 1 Year, 1, 2, 3, 4, 5, 6-10, 15, 20, 25, 35, 45, 55, 65, 75, 85, 90+).

* The details of the change in the limits of the district of Chester on 1st August 1871 are stated in Table 67, page cxxi. The above figures for the whole year relate to the district as at present constituted.

VIII.—NORTH WESTERN COUNTIES.—DEATHS at different Ages, 1871.—DISTRICTS.

Table for Districts 33 (CHESHIRE) and 34 (LANCASHIRE). Columns include Districts, Total Births, Total Deaths, and Ages at Death (Under 5, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, 95 & upwards).

IX.—YORKSHIRE.

Table for Districts 35 (WEST RIDING) and 36 (EAST RIDING). Columns include Districts, Total Births, Total Deaths, and Ages at Death (Under 5, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, 95 & upwards).

* See note (*) on opposite page.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all Diseases are classified in the Tables of Causes of Death, pp. 146-149, under 116 heads; some of these heads, however, include groups of diseases which are very distinct from one another, but which either are fatal to only a few persons, or are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers

CAUSES of DEATH at different Periods of Life, in the Year 1871.

would not materially interfere with the calculated proportions. Where it is desired, partial correction, however, can be made by means of the following Supplementary Table, containing the deaths from many distinct diseases, such as chicken-pox, mumps, &c. &c., which in the preceding Tables, have no separate classification, and also many of the deaths from various forms of disease (such as softening of the brain, necrencephalus, deaths from which are included under "Brain Disease, &c.") which in some cases are returned under other heads.

Class and Order in the Table of Diseases, under which the Cause are tabulated.	CAUSES OF DEATH.	ALL AGES.	AGES OF FEMALES.

APPENDIX.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by WILLIAM FARR, Esq., M.D., F.R.S.

YEAR 1871.

SIR,

THIS year is memorable for an epidemic of small-pox, which ravaged several parts of the kingdom in a way of which there has been no example since the year 1838, when the deaths by small-pox were 16,268. In the 24 consecutive years that ended in 1870, the annual deaths by this disease ranged from 1320 in the year 1861, to 7684 in 1864. The latter number they never exceeded until the year 1871, when the deaths by this single disease ran up to 23,126. The outbreak had all the suddenness of an explosion, for the deaths in the two previous years had been but 1565 and 2620.

The Compulsory Vaccination Act was passed in 1867, and was followed for three years by a period of quiescence of the variolus infection, but it was the quiescence of slumber and not of extinction.

A second Act of Parliament was passed in 1871, and is now in operation.

Under the provisions of the Metropolitan Poor Act of 1867 certain hospitals were provided for the reception of small-pox cases; and the Managers of the Metropolitan Asylum District at the close of the 1870-1-2 epidemic appointed a Committee, consisting of Dr. Brewer, the chairman of the Board, Mr. E. H. Galsworthy, and others, "to report upon the returns obtained from the several hospitals of the Managers, with regard to the cases of small-pox treated therein, from the opening of the several hospitals to the 30th of April 1872."*

The Committee shows that 14,808 patients were treated in the hospitals, where 2763 of them died. The mortality was at the rate of 19 per cent. on the cases treated. Of 903 children under 5 years of age treated, 471, more than the half, or 52 per cent. died. Of children aged 5 and under 10, the mortality was 26 deaths to 100 cases treated; at the age 10-20, the mortality was at the lowest; it was 9 deaths in 100 cases treated: at the 3 higher decennials 20-50 the mortality (as in other acute diseases) increases to 17, 24, and 29 per cent. The mortality of cases was higher among males than among females at nearly all ages.

11,174 cases occurred in persons vaccinated, 3634 in persons unvaccinated; but to show the relative susceptibility, the reporters properly observe, that the numbers of the two classes exposed to infection should be taken into account. They have apparently made some inquiries on the subject; and say, "it is estimated that, even previously to the commencement of the present epidemic, the vaccinated were about 19 times as many as the unvaccinated." So that putting x for the number of persons in London unvaccinated, we shall have, if the estimate is correct, this result:—

- (1) Out of x unvaccinated persons, 3634 attacked were treated in the public hospitals.
- (2) Out of 19 x vaccinated persons, 11,174 attacked were treated in the public hospitals.

* Metropolitan Asylum District. Report approved by Managers, July 13th, 1872.

So that if we can assume that the (1) unvaccinated, and the (2) vaccinated resort to the hospitals in nearly equal proportions, it will follow that out of the same numbers living more than six times as many unvaccinated were attacked as vaccinated. The treated attacks of the vaccinated, taking numbers into account, to have borne the same proportion to the living, should have amounted to 19 times 3634, or to 69,046. They actually amounted to 11,174.

This point is so important, that looking to the active opposition compulsory vaccination encounters, competent persons should be empowered in epidemics to make full inquiries into the proportions of the population having or not having decisive marks of vaccination; and at the same time arrangements should be made for procuring returns of the actual attacks in the two classes of people.

Upon one point there can be no doubt. Cases of small-pox in persons unvaccinated, and treated after admission with the best skill in the various hospitals, are excessively fatal; 1628 in 3634, that is 45 in 100 such cases end in death.

The vaccinated here again enjoy a relative immunity; yet even of them 1135 cases in 11,174, or 10 in 100 terminated fatally.

Vaccination, therefore, does not afford entire immunity against attack or even death by small-pox: but it unquestionably affords protection to a large extent against attack, and in the event of attack it renders the disease much less fatal than it would otherwise be.

To illustrate the relative protection, assume merely for illustration that in 100,000 vaccinated people, 100 are attacked and treated in the hospitals, then, as we have seen, 10 of them die.

Now take 100,000 unvaccinated people exposed to nearly the same sources of infection, then, according to the previous data, at least 600 would be attacked and treated, of whom 270 would die.

7912 persons died of small-pox in London alone; and of these deaths 2580 are said to have occurred in persons who had been vaccinated. 3529 deaths occurred in persons not vaccinated; and if the population vaccinated was, to the population unvaccinated, in numbers as 19 to 1, it is evident that if vaccination afforded no protection against small-pox, the deaths of the vaccinated would have been 19 times 3529, or 67,051: they were 2580, so that the chances of death by this disease were reduced in these proportions. This is, moreover, an under-statement, as the greater part of the 1803 deaths, registered without any reference to vaccination, belong to the category of the unvaccinated, for the poor parents naturally feel indisposed to criminate themselves by recording their own negligence.

Vaccination was shown by Mr. J. F. Marson, F.R.C.S., to be a relative term, and to be a matter of degrees: the efficacy of its protection against death by small-pox varying with the quality and the number of scars. The Committee's researches bear this out. Thus they show that the mortality to 100 treated cases of each category was 48 in the patients without marks; 25 in those with one or more bad or indifferent marks; 5 in those with *one* good mark; 4 in those with *two* good marks; 2 in those with *three* good marks; and only one in those with *four or more* good marks. The mortality was 4 in 100 treated of those that had *one or more good marks*. Thus it is the general rule that the mortality is inversely as the marks of vaccination. A point of very great importance is the high rate of mortality in the small-pox hospitals. Dr. Seaton quotes a return by 156 medical practitioners, showing that the deaths in cases which they had met with in the natural form of the disease were about 20 per cent.,* which agrees with Jurin's estimate of one death in five or six cases. Now the deaths of the unvaccinated in these London Hospitals were 45 per cent., double the mortality of cases in private practice where the patients were treated at

* Handbook of Vaccination. By E. Seaton, M.D., p. 191 and 212.

their own homes. And in vaccinated patients suffering from small-pox, while 10 in 100 died in hospital, only 3 in 100, according to the returns of the Epidemiological Society, died of those treated at their own homes.

Two explanations of the high relative mortality in the hospitals are offered. The first is that the worst cases are taken to the hospitals in undue proportions. This may be the case, but when the characters of the cases treated at home and in hospitals are carefully analysed, as they should be, it will probably be found that the selection against the hospitals is far from accounting for the whole difference. There will remain a residual element: aggravation of the dangers attendant on variolation by the contiguity of patients breathing a common atmosphere. The probability that a man will die by small-pox is increased to some extent by carrying him from healthy quarters to the ward of a small-pox hospital; but at the same time the probability of the diffusion of the disease among the population is much diminished. This, taken in connexion with the fact that many patients are without rooms to themselves, without friends, and so without the means of obtaining help, nutriment, and nursing at home, justifies the policy that has been adopted.

This disease is a type of zymotic diseases; it is induced by a species of matter, which I proposed to call *variolads*, possessing a life of its own, enduring for a definite time; capable of propagation in the bodies of living men, which have not before been subject to the process of variolation; subject to variations of intensity; doomed to decay in the course of a certain number of days in the living body, and in still less time in the body whose natural forces are slain by its usurping domination.

The chances of its extension in the population vary with circumstances; but generally they are increased by proximity, and by dirty habits. An epidemic of small-pox usually commences at one or more central points; which may be interpreted as implying that there, under conditions favourable to their developments, varieties of *variolads* of extraordinary vigor, spring into existence, and are propagated through the usual channels. The English epidemic of 1871 sprang up in the east end of London about the 40th week of 1870. The weekly deaths by small-pox in London had been so low as 2 in the 15th week of that year; they ranged from 9 to 15 between the 27th and 30th week; from 13 to 27 in the next 5 weeks; then suddenly rose to 40 in the 45th week, of which no less than 22 were in the East Districts, including Shoreditch, Bethnal Green, and Whitechapel. By the 52nd week of 1870 the deaths by small-pox in London were 110; of which 47 occurred in the East Districts, while of the 13 in Islington West, where the small-pox Hospital is situate, many probably came also from the East Districts. The epidemic ran up rapidly to 288 in the fifth week of the June quarter.

The epidemic attacked Lancashire immediately, but attained its maximum in the first quarter of 1871. The tenth Division, especially the colliery districts of Durham and Northumberland, suffered severely late in the year. The whole country was more or less affected. In the districts that suffered most vaccination had been most neglected. The distribution of the disease over the kingdom is shown in detail in the Table commencing on p. 184. It may be noticed that in 123 of the 627 Registration Districts no death from small-pox was recorded.

I will now pass in review the fatal diseases of the year in the five classes.

I.—ZYMOTIC DISEASES.

The 123,030 deaths by this class of causes, marshalled under four orders, exceeded the average numbers; and the excess was entirely due to small-pox, on which I have already commented. In the previous year the excess was due to the epidemic of scarlet fever. Since the year 1865

diarrhœa has been unusually fatal. The cholera epidemic of 1866 was preceded and followed by epidemics of diarrhœa; and as cholera was propagated through the waters polluted by its specific matter in rivers and wells, it is probable that diarrhœa is distributed through the same medium. In the miasmatic order, scarlet fever, which was at its maximum in 1870, was still a leading disease; but fever was declining. Enteric fever was by far the most fatal of the three forms of continued fever.

Among the enthetic diseases propagated by direct inoculation, syphilis is the most fatal, for to it 1742 deaths were referred. The rate of mortality by this disease is lower than it was in the three previous years; and we may hope to see it still further reduced if proper precautions are taken to stop it at its sources.

Hydrophobia prevailed quite epidemically in this year. Never before did so many die of this distressing disease. The deaths by it in the four years 1868-71 were 7, 18, 32, and 56. Police measures should be taken to stop its progress.

To alcoholism in one form or other 740 deaths were referred; 370 having been registered as *delirium tremens*, and 370 as intemperance. This class of deaths attained the highest pitch in 1865 when 612 deaths by *delirium tremens*, 437 by intemperance were recorded; since that date the deaths have declined.

No doubt many other diseases are indirectly the result of drinking to excess, so that the deaths by alcoholism are understated; but as the relative accuracy of the returns is probably increasing, the fall of the deaths from 1049 in 1865 to 740 in 1871 is evidence of decrease in the bad habit of drunkenness. Certainly these returns lend no countenance to the notion of the increase of intemperance. The parasitic diseases, including thrush as well as worms, were not more fatal than usual.

II.—CONSTITUTIONAL DISEASES.

One of the diathetic diseases, gout, is more fatal than *delirium tremens*, and in its various forms is sometimes entered under disguised names. Excess in eating among the higher classes is unquestionably little less fatal than excess in drinking; and the two excesses cannot be too much guarded against by the aspirants after longevity. Scrofula, tabes, hydrocephalus, and phthisis were all below the average rate of their fatality. (See Table 10, pp. 244-7.)

III.—LOCAL DISEASES.

This is of all classes the most fatal, as it embraces all well defined local affections. The most fatal order embraces the diseases of the respiratory organs; and it is growing yearly more fatal. The death-rate by bronchitis rose from 1188 per million in the years 1850-59 to 1749 in the ten years following, to 2097 in 1870, and to 2112 in 1871; bronchitis under its name is apparently absorbing cases formerly accounted as pneumonia or asthma and perhaps as phthisis. This may be due partially to change of nomenclature and improved pathology, but it is also probably due partly to the imperfect ventilation, and to the dust of mines, shops, and factories.

The deaths by affections of the brain, nerves, and senses vary little from the average; and there is no evident increase; to convulsion fewer deaths were referred than in previous years; yet their number was 25,309. Apoplexy and paralysis and insanity were somewhat more fatal in the year than previously.

Heart disease is occurring more frequently in the returns than it did, and its causes require fuller investigation. It is now fatal to 1 annually in every 1000 living, and the deaths in the last year were 26,219.

Diseases of the digestive organs were not fatal to so many; yet of them 21,621 died, including 8711 by the various affections of the liver.

The diseases of the urinary organs were fatal to 7628 people; those of the organs of generation, locomotion, and the integumentary system together were fatal to only 4616 lives.

IV.—DEVELOPMENTAL DISEASES.

These are diseases incidental to development, to growth, and to senile decay. 9650 deaths are ascribed to premature birth, 1418 to malformations including 570 by cyanosis, 390 by spina bifida, 458 by other malformations, and 4108 by teething.

The mothers who died in childbirth were 3935; including 1464 by puerperal fever (*metria*) which during the last two years has been more prevalent than it had been since 1864 and 1865 when the disease was epidemic. The excess in the number of 2471 deaths from what have been called the accidents of childbearing tells strongly in favour of the efforts that are being made for the education of the midwives by whom so many of the women of England are attended.

The deaths of children under one year of age amounted to 125,868. No less than 9650 of these were born prematurely; that is, the natural term of intra-uterine life being nine months, during which the organs are matured under favourable circumstances, these, as well as other untimely births, were cast on the world before that period either by some affection of their own system or of their mothers. This number died. A certain number survived. The causes of the deaths of 22,463 are returned as atrophy and debility; these are cases of defective nutrition. Nearly the same number or 20,089 are classed as deaths by convulsions. Then 15,662 of the deaths were by diarrhoea. Thus, adding these numbers together, we have 58,214 deaths of infants from causes by no means clear; by ill-defined diseases; or by diseases which are symptoms either of other diseases or the consequences of improper nutriment.

The deaths of 1224 infants are directly ascribed to the want of breast-milk, and no doubt this is only a small proportion of the numbers who die or are irreparably injured for want of nature's food.

A large number of the deaths of infants were from small-pox, measles, scarlet fever, and whooping cough; scrofula, tabes, phthisis, water on the brain. Bronchitis and pneumonia are two of the other great causes of infant death; to those diseases 18,245 deaths are due.

1723 infants died violent deaths, of which 1568 were returned as accidental, including 1098 infants suffocated, generally by overlaying, as it is called, by the mother, during her sleep.

147 cases of infanticide out of the 125,868 dying were returned by the coroners.

I some time ago determined the rates of mortality among children, and found that England occupied an intermediate place in the scale; in Norway, in the cold North, the mortality was lowest; in Italy, in the warm South, it was highest.

At the same time I was favoured with replies to inquiries respecting the treatment of infants in Scotland, Norway, Sweden, France, and Austria by Dr. Stark, Professor Aschoug, Dr. Berg, M. Legoyt, and Dr. Herz.*

For England I have been favoured with replies to the queries in a valuable paper, for which the country is indebted to the Obstetrical Society of London; and as the paper throws much light on the causes of the infant mortality recorded in the Registrar General's annual reports,

* The replies were published in the Statistical Journal of 1866, vol. xxix. pp. 1—35, as an Appendix to the paper on the Mortality of Children in the Principal States of Europe.

statists will be glad to see its principal passages printed as a supplement to this letter.

This question of the treatment of infancy is much larger than it looks at first sight ; for every man born goes through this period of initiation. Now in England about 800,000 children are born annually, and by the Life Table 119,594 of them die in the first year, some from congenital weakness and blight, but great numbers, not I conceive from the cruelty of their parents, but either from the necessities of their condition in life, or from their ignorance of the best modes of nursing children. If so many die, 680,406 survive to testify to the thousands of cares they have received from their parents often struggling for subsistence ; to bear marks through all life of their treatment during the first year of life. It cannot be doubted that an English child born in London for instance, and nursed by its parents at home, must grow up into a creature very different from the foundling, committed by its parents to the care of the city hospital, who grows up into a French citizen in Paris, or a young Muscovite in Moscow. Even that practice of binding the baby's limbs in bonds from its birth to keep, it is said, the young struggler out of mischief, leaves its traces in the soul ; which can scarcely be expected ever after to lead a life of sober liberty. It is to the credit of English women that the barbarous practice is not in use in this kingdom.

Cookery, the preparation of food for adults, is worthy of study, but to the child it is of paramount importance ; nature supplies milk for the first months, then art intervenes, takes the nursling in hand, and gradually prepares it for the years of childhood.

V. VIOLENT DEATHS.

The number of violent deaths in England is exceedingly great, and it is increasing. The numbers so returned were 11,727 in 1838, 14,040 in 1854, and 16,993 in 1871. A part of the increase is due to increase of population ; but correcting for this, the general result is, that in the year 1854 the violent deaths to 1,000,000 living were 759, on which there was no considerable increase until the years 1863-4-5, when the rate of violent deaths rose to 772, 826, and 835 ; that year, 1865, was the maximum, for through the next five years the rate declined to 745 in 1870, but was 752 in 1871.

By suicide the deaths to the million living were remarkably uniform ; 66 in 1858 and 66 in 1871. By homicide, including infanticide, in the same years the rate was 18 and 17, there having been a slight swell up to 23 in the cholera year 1866 ; executions declined.

The greatest reduction is in the violent deaths by burns and scalds, which fell from 162, 153, and 161 in the years 1858-59-60, to 116 in each of the last two years 1870-1. We may hope to see a further decline in these fearful deaths, of which so many arise from negligence.

The deaths by drowning registered at home have also declined. The numbers drowned at sea were registered by the Registrar General of merchant seamen ; they amounted to 2476, of which 1500 happened by wreck, 976 by other accidents or negligences. We may hope to see a still further decline in the deaths from accidents in mines or on railways.

I have the honour to be,

Sir,

Your obedient servant,

WILLIAM FARR.

To

The Registrar General.

Supplement to Dr. Farr's Letter.

REPORT OF THE INFANT MORTALITY COMMITTEE OF THE OBSTETRICAL SOCIETY OF LONDON, 1870.

(Reprinted in abstract from vol. XI. of Transactions, by permission).

The President, Dr. W. M. Graily Hewitt, stated that the paper about to be read was of a peculiar character. Some time since Dr. Farr, of the Registrar General's office, communicated to the Society his desire to obtain information* as to the treatment and management of infants in this country, with a view to ascertaining the extent and causes of infant mortality, and requested the Society to use the resources at its disposal for obtaining this information. His request was at once acceded to. The Council appointed a committee on the subject, which since then had been at work. A series of questions was drawn up, printed, and a copy sent to each Fellow. A considerable number of answers had been obtained, and Dr. Gervis, one of the hon. secs. of the Society had, at the request of the committee, drawn up an analysis of the replies thus elicited, and the paper now to be read was the analysis in question. The Council had decided to bring the matter thus far advanced before the Society, the subject being a highly important one, and in order also that those Fellows of the Society who had not yet contributed information on the subject might be induced to do so.

REPORT.

The Committee appointed by the Council of the Obstetrical Society to investigate the causes of Infant Mortality, in presenting to the Fellows the result of their inquiries, while on the one hand, they must express some regret that they were not favoured with a reply to their circular from a larger proportion of the gentlemen to whom it was addressed, on the other hand, cannot but congratulate themselves and the Society on the fact that through the medium of this investigation a very considerable addition has been made to our knowledge of the circumstances attending the birth and early life of infants in various parts of the country, and many valuable suggestions offered from which they trust by the influence of this Society on the public mind much benefit may ultimately accrue.

Question 1.—The first question asked relates to the proportion of births attended by medical men and by women respectively, to the amount of instruction possessed by the women, and to the mode of procedure adopted with the infant immediately after its birth. From the replies given the following general statements are deduced,—that among the poor population of villages a large proportion varying from 30 to 90 per cent., are attended by midwives. Thus, in Flegg-Burgh in Norfolk, with a population of 554, Mr. Waller reports that 30 per cent. are attended by midwives. In Gringley, near Bawtry, Notts, with a population of 874, Mr. Raynes reports the number as 46 per cent., and at Bromyard in Herefordshire, population 1,300, Mr. Marley reports that as many as 90 per cent. are attended by midwives. In the small non-manufacturing provincial towns, on the other hand, attendance by midwives prevails to a much less extent, with a few exceptions. The large majority of the returns puts attendance by midwives in towns of a population of from 6,000 to 10,000, as varying from 5 to 10 per cent., and in some few as not occurring at all, *e. g.* in Lewes, with a population of 3,716, there is stated to be none. In Long Sutton, however, with a population of 6,124, Mr. Ewen reports that attendance by midwives occurs to the extent of 26 per cent.; in Altrincham, in Hampshire, with a population of 6,628, Mr. Blease reports that attendance by midwives reaches as high a figure as 53 per cent. In the large provincial towns, and especially in the large manufacturing towns, attendance by midwives among the labouring population occurs in almost as large a proportion as in the agricultural villages. Thus, in Glasgow the return is 75 per cent., in Coventry, 90 per cent. In Leeds, Sheffield, Birmingham, and Bury, the proportion is not stated in figures, but stated either to be large or the larger, in comparison, *i. e.* with attendance by qualified practitioners. In Wakefield, however, with a population of 23,000, Mr. Fowler reports that, while among the Irish, attendance by women prevails to a very large extent, among the English nearly every

* The following Questions were submitted by Dr. Farr for the purpose of eliciting the required information:—

1. How are children brought into the world? *i. e.*, are the mothers attended by women or by medical men? Are the women instructed? And, if not, what is the mode of procedure with the baby as to umbilical cord, dressing, feeding, covering up, warming, &c.?

2. Are the children suckled by the mother? For how many months? Do they get artificial food, and of what quantity and quality?

3. Describe briefly the life of the baby at ages six and twelve months through the twenty-four hours. The hours of sleep, dressing, washing (with hot or cold water), food, drink, nursing in cradle or otherwise by mothers or maids, going out into the open air, or being shut up in bedrooms, physis, drugs, or spirits?

4. Is there any other matter likely to influence the life; such as accumulation in hospitals, lodgings, &c.?

5. Are children deserted, sent to hospital, or ill-treated? Is infanticide uncommon?

case is attended by a medical man. In Edinburgh, as reported by Dr. Matthews Duncan, attendance by midwives would appear to occur to but a trifling extent. Lastly, from London the reports vary accordingly as they come from the east or west end, or from the suburbs. In the east of London, as Stepney, Barking, and Stratford, it would appear that from 30 to 50 per cent. of the poor are attended by midwives. In the west end, on the other hand, the proportion is very slight; thus, Mr. Curgenven, Dr. Bloxam, and Mr. Gaskoin report that it amounts to 2 per cent. or even less. In a suburb such as Wimbledon, Dr. Payne states the proportion of midwifery attendance by women to average about 5 per cent.

To the question, Are the women instructed? answers in the negative have been received from all parts of the country, with the exception of Glasgow and Sheffield, where Dr. Yeaman and Mr. Hime respectively report a certain amount of education to exist among the better class of midwives. From several districts the replies indicate not merely a want of any special education, but gross ignorance and incompetence, and a complete inability to contend with any difficulty that may occur. In London, on the other hand, it would appear that there are many women practising midwifery who have received a certain amount of instruction at various institutions, but these, although fairly competent in ordinary cases, are also quite unequal to any of the emergencies of Obstetrics.

Under the third section of the first question,—that relating to the mode of procedure with the infant after birth,—nothing of much new interest has been ascertained. The ordinary treatment of the umbilical cord appears to be generally carried out—the only variety being in the length of cord allowed to remain, this varying from one inch to three inches. In reference to the binder fastened around the infant's abdomen, Mr. Curgenven remarks that it is often much too tight, so much so indeed as not infrequently to induce convulsions.

In country districts the custom of giving some aperient to the infant shortly after its birth appears still to be very prevalent, less so in the larger towns, still less in London. The aperient varies much in kind. Butter and sugar, gruel, and castor oil are the most common; but in Chelmsford a favourite dose would appear to be milk and sugar; in Sheffield, treacle; and in Altrincham, a teaspoonful of cold water. No report has been received of any great delay being common in putting the child to the breast. Twenty hours is the longest period mentioned as being allowed to elapse.

Question 2.—The second question has reference to Lactation and Feeding. Among the married poor suckling is evidently the rule, and a large amount of testimony is borne to the fact that it is often unduly protracted, even to eighteen months and two years, for the most part with the hope that it may prevent a rapid recurrence of pregnancy. Illegitimate children among the poor, on the other hand, are rarely suckled; and this, whether entrusted to the grandparents, as is often the case in the manufacturing towns, or put out to nurse by the day, or altogether, as is common in London. These are nearly always wholly brought up on artificial food. Among the married poor also it appears nearly universal to give the child artificial food as well as the breast, and that from a very early date. In both cases, *i. e.* where it only supplements lactation, and where it altogether replaces it, the food is generally improper, either in quality or quantity. It consists for the most part of bread soaked in water or milk, and sweetened, arrowroot, sago, or corn flour, baked flour, and biscuit food; all generally of too substantial a consistency, and too exclusively farinaceous.

Among the upper classes it would appear that the tendency for mothers not to suckle their children is on the increase; but here either wet nurses are employed, or the food during the first few months of its life being much more judiciously arranged, so as to contain a much larger proportion of diluted cow's milk, and a much smaller proportion of the farinacea, the injurious results of improper feeding are not seen as among the lower classes. Mr. Curgenven and others remark that a large number of women in London fail to properly suckle their children through a deficient secretion of milk.

Question 3.—From the answers to the third question, which relates to the mode of life (apart from the subject of their food) adopted for the infants in various districts, no fact of new importance has been elicited; but much that was previously known has been confirmed, and much that is interesting narrated.

Both in agricultural and manufacturing districts it seems to be the custom among the poor to let the infants live to a very large extent in the open air—under the care of elder sisters, often, however, little more than infants themselves; and this out-of-door life they lead would appear to compensate to a considerable extent for the smallness of their rooms at all events by day. In the night, however, the want of due ventilation in the crowded sleeping rooms is a serious evil, and prejudicially affects not only the younger members of the family, but also their seniors. Sleeping is encouraged to the utmost attainable extent, and there is too prevalent a tendency to look upon waking as an indication for food, and should it fail in securing renewed sleep, for cordials, such as gin, or narcotics, such as syrup of poppies, or paregoric. Another plan much adopted to quiet infants is to allow them to remain in their cradles, and to keep them sucking at the bottle for a time much beyond that occupied by the mere meal. The effect of this upon gastric digestion is probably, to some extent at all events, prejudicial, and has attracted the attention of some writers under the head of "fruitless sucking." Washing among

infants appears to be fairly attended to; they get some sort of a wash morning and evening, and generally in warm water. When they pass, however, out of the limits of infancy, the care taken of them in this respect gets much less, though it may be here remarked, and this remark equally applies to all the details of infant life, that the first-born child, as a rule, gets much more care and attention throughout its entire infancy than say the seventh or eighth. As regards dress, the tendency certainly is, both in summer and winter, but especially in winter, to err on the side of insufficiency. Considering the comparative feebleness of the circulation of an infant, and the changeableness of this climate, after it has arrived at the stage of its existence when its clothes are shortened, the scanty nature of its dress is an unquestionable source of internal congestions and consequent disease.

The question of food was chiefly considered under Question 2, but a few particulars are here added. Even where suckling is more or less carried out, as has been stated, it appears to be very general to give some artificial food as well, and stress has been laid upon the too exclusively farinaceous character of that food in the early weeks of the child's life. But in the latter months of the first year errors in diet are even more flagrant, and it is no uncommon thing to hear from the mother, in reply to questioning, "It has, sir, what we have," and on minute inquiry what they have proves to include vegetables, uncooked fruit, meat, salt fish, cheese, heavy pastry, and beer. Under these circumstances it is little to be wondered at that bowel and mesenteric disease, followed by general wasting, is so alarmingly prevalent. Indeed, this question of improper feeding must be held accountable for a very large proportion of the excessive infant mortality which prevails.

On the last topic touched upon in this question—the administration of cordials, medicines, and spirits—a very large amount of testimony comes from nearly every quarter (the chief exception being the agricultural villages), that it is a practice extremely prevalent among the poorer, and especially the operative classes. The only exception to this statement comes from Wakefield, and this may be more apparent than real, where Mr. Fowler reports that systematic dosing with anodynes does not prevail. In all the other large towns the general tenor of the reports is that it is "enormous," and many particulars are given as to the quantities sold by chemists and druggists. Thus, even in a small town like Long Sutton, in Lincolnshire, with a population just over 6,000, one chemist alone sells twenty-five and a half gallons of Godfrey's Cordial annually, and another in the same town six imperial pints weekly.

Besides Godfrey's Cordial, tincture of opium, paregoric, syrup of poppies, and Steedman's Powders are the favourite medicines. As regards the administration of spirits, there is also too much reason to fear that, except in country villages, which in this as in some previous matters appear again to have the advantage, it largely prevails. The spirit chiefly given the children is gin, and in some cases doubtless with the idea of relieving flatulence, but in more with the hope of obtaining its narcotic effect.

Question 4.—The fourth question relates to the immediate effects of putting children out to nurse, and from the answers received it would appear that, except in the case of illegitimate children, and the children of the poorer class of millworkers, this is not a very prevalent practice. In the agricultural districts it scarcely prevails at all. In the northern manufacturing towns the wages of the majority of the operatives is sufficiently good to enable them, not only to have houses of their own, but to maintain their wives at home; when, however, a girl, who is a millworker or a domestic servant, has an illegitimate child, it is almost invariably put out to nurse, and its temporary guardians very frequently are the grandparents. It is rare in these towns for a woman to have more than one nurse-child to take care of. Baby-farming, in the sense of an accumulation of babies in one room or house, does not, indeed, out of London, appear to be much carried on; where it is, in London and its neighbourhood, the testimony is invariable as to its prejudicial effects on the infants. Thus, Dr. Payne, of Wimbledon, writes, "A nursery of three or four children never does well; the air of the room becomes foul, and they all droop and fall away in flesh, even with the best food, attendance, and cleanliness." And Mr. Curgenvin states that of the illegitimate children put out to nurse in London, 80 per cent. die.

Question 5.—From answers to the fifth question it would appear that in the country there is much less ill-treatment of children, desertion, concealment of birth, and infanticide than in London. In the case of country villages and towns this would appear partly to arise from the willingness of the father to marry the mother of the child where possible. Indeed, in many parts of the country it is the invariable custom for the marriage ceremony not to be sought until advancing pregnancy renders it desirable, and it is often postponed until after the confinement has taken place, as by the infant per chance being stillborn, the chief reason for marriage is removed. Such at all events is the case in many agricultural and mining districts. In the large manufacturing towns this comparative absence of the direct ill-treatment of children is largely due to the absence of shame with which illegitimacy is regarded, it being very common, as mentioned under the last section, for one or other of the grandparents to attend to the illegitimate child or children of the daughter. Of indirect or unintentional ill-treatment, however, there is everywhere much to complain of—ill-treatment, *i.e.* arising from the poverty, ignorance, and intemperance of the parents, from the want of comforts and even necessities in their homes, and from consequent exposure, insufficient feeding, and neglect. There

is one variety of ill-treatment, or what is equivalent to it, which deserves especial animadversion, and that is the neglect which appears to prevail in some towns to call in medical advice in the case of the illness of the infants until medical advice is useless. Thus, Mr. Fowler of Sheffield writes, "It is quite common for women to defer sending " for medical aid, when their children are ill, until it is almost too late. They do this " quite consciously, and say to the doctor, 'Little un's very bad; you can't do no " good, but we want you to see un in case ought should happen, so as you may give us " a paper.'"

While, however, the intentional ill-treatment of children appears to be but little prevalent, their desertion, especially in the case of illegitimate children, appears much more so. Desertion of families by fathers would appear to arise from intemperance, poverty, and immorality; by mothers it is much rarer, and arises chiefly from immorality, *i. e.* from the forming of an illegal connection with another man. Desertion of illegitimates in London is frequent; the mother being anxious to be rid both of the pecuniary burden connected with the support of the child, and of the evidence of her guilt. She frequently, therefore, leaves the child with the woman who undertakes to nurse it, and the ultimate lot of the child so deserted is either death by slow starvation and neglect, or the workhouse. The same tendency exists in the large provincial towns, but in the smaller ones women cannot move from one part of the town to another without its being known, and unless they leave the town altogether it is much more difficult for them to abandon their children. The same causes too, which in the manufacturing towns influence the question of ill-treatment, influence also the question of desertion, *i. e.* on the one hand the high rate of wages obtained by the millworkers, and on the other shamelessness with which illegitimacy is regarded. An anecdote narrated by Mr. Fowler, of Wakefield, well illustrates this. A woman was asked on her applying for medical aid in her approaching confinement how many children she had had before. She volunteered the following: "Let's see—first wor a chance un; second wor a chance un; third wor all right; this is fourth." Another woman applied to the parish for relief on the birth of her sixth bastard. It was known that she was herself a bastard, and as her mother was there, the question was put to the old lady, "Have you ever had any illegitimate children?" "Yes, your honour, six." "Are you not ashamed of yourself?" "Ashamed, no! I've worked for 'em, and 'ave kep 'em; why should I be ashamed?"

With respect to concealment of birth and infanticide the replies from the country without exception intimate that neither of these crimes are common. Thus, Dr. Holman, of Hurstpierpoint, reports that he is not aware of any case of infanticide having occurred in the town within his experience, and in twenty years but one case of concealment of birth; and Mr. Ewen, of Long Sutton, says that concealment of birth is very uncommon, and that he has heard of but three cases of infanticide in forty years, and more or less similar testimony is borne by all our country Fellows who have replied. On the subject of infanticide in London we are unable from the replies received to give any adequate report. In answer to the question. Is infanticide common? nearly every gentleman has simply written "no." Yet though this doubtless represents accurately enough the infrequency with which the Fellows of the Society, in their own practice, are brought into contact with infanticide, the reply of Dr. Bloxam probably more nearly represents the truth. Dr. Bloxam writes, "Judging by the frequency of coroner's inquests " on cases in which the child has evidently lived, and death said to occur from apnea, " I should say yes." Probably a special return on this subject requested from the medical officers of the police force would yield statistics of more exact value.

Question 6.—The first section of the sixth question refers to the annual average of illegitimate births known to the Fellows of the Society in their respective districts, and asks information as to the number of illegitimate children who live over one year. In answer to this question the majority of the gentlemen who have replied have given the number known to them personally, and this would obviously be influenced much by the character and extent of their own practice. Thus, Mr. Marley, of Padstow in Cornwall, writes that out of 233 births attended by him in the preceding year, 22 were illegitimate. Dr. Hewitt, of Winkfield, in five years has had but 3; Dr. Coombs, of Bedford, 7; Mr. Curgenvin, 6; Dr. Payne of Wimbledon, 5; Mr. Hall, of Barking Road, 2; and so on. A few gentlemen give averages; thus in the practice of Dr. Mackinder, of Gainsborough, the illegitimate births averaged 9.9 per cent.; of Dr. McVeagh, of Coventry, 5.46 per cent.; of Dr. Blease, of Altrincham, 4 per cent. Other gentlemen send particulars of illegitimate births in the towns irrespective of their own practice. Thus Mr. Fowler reports that in Wakefield from January 2nd, 1863, to January 2nd, 1868, there were 197 illegitimate births registered; in Sheffield, Mr. Hime reports that from 1863 to 1867 inclusive, there were 845 applications made by mothers of illegitimate children to the police, and that out of 510 births in the workhouse in 5 years 303 were illegitimate.

Dr. Yeaman, of Glasgow, reports that in the Glasgow Lying-in Hospital during six months there were 195 deliveries, of which 145 were illegitimate, and that in the same period of 318 out-door cases 36 were illegitimate. At Hurstpierpoint Dr. Holman reported that in five years 1253 births have been registered, of which 49 were illegitimate. Mr. Price reports that in the Leeds Gaol out of 29 births in five years, two thirds have been illegitimate.

To the second portion of this question some more exact replies are given. In Wakefield the report states that 26·22 of the illegitimate children die under one year; in Coventry, 40 per cent.; in Padstow, 50 per cent.; in Bawtry, Mr. Raynes states that the average number of illegitimate births during the last five years has been 8, and that all die under one year; Mr. Snell of Stepney, says that a great many illegitimate children have been under his care, without specifying numbers, and that all have died under one year. Of the 6 cases known to Mr. Curgeven all have died under one year of age; Dr. Mackinder, whose average is just 10 per cent., says very few live over a year; on the other hand, Dr. Hewitt, of Winkfield, says of the three cases which have occurred in his practice all the children are alive and well; Mr. Waller, of Flegg-Burgh, Norfolk, writes—"Although in this county as regards illegitimate births we stand highest but one, *i. e.* Cumberland, the lives of illegitimates in my district at all events are as good as of legitimates."

From data such as these not given on any common basis, it is difficult satisfactorily to generalise; still on the whole it would appear with respect to the latter of the two inquiries that in spite of such a striking exception as Padstow, in the strictly rural districts the lives of illegitimate infants are as good as those of the legitimate, that in the manufacturing towns an average of at least 35 per cent. die under one year of age, and that in London we should not be far wrong in placing the per-centage at a much higher figure, probably about 75 per cent.

And with respect to the inquiry as to the frequency of illegitimacy, the returns from Norfolk would appear to confirm the previous impression which obtained as to its pre-eminence in this respect among English counties. In questions of health, rural districts have, so far as our replies extend, on the whole come out well, indeed the best; but on this question of illegitimacy, country towns would appear to have the advantage of them, and even probably London itself. It is, in fact, difficult to decide on this point between sparsely populated agricultural villages and densely populated manufacturing towns. From Scotland the only answers received have been from Edinburgh and Glasgow, and it would appear from them that, as in the case of the English metropolis, so in the case of the Scottish, it has somewhat the advantage over the large manufacturing towns, of which Glasgow may be taken as the representative.

The last topic of the circular, and perhaps the most important, treats of the possibility of preventing so large a mortality among infants, and invites suggestions from the Fellows on the subject. It may be as well to arrange these suggestions under two heads; the first including those suggestions in which all agree; the second those which are advocated by particular Fellows. The first deal chiefly with the questions of food and hygiene. All agree in the importance of mothers suckling their infants for a certain number of months, and in the mischief arising from the practice of giving infants of but a few weeks old solid farinaceous food, not to speak of still coarser fare. Where the mother cannot suckle, whatever the cause, no food beyond milk and water, provided the milk be of a good quality, should be given the infant for at least the first three months. All lay stress upon the importance of improving the education and as speedily as possible the dwellings of the working classes:—the education, so that the infants may not continue to be in so great an extent the victims of ignorance, tradition, and prejudice in the matter both of their food and hygiene; and the homes, so that the effects of overcrowding, want of air and light, and imperfect drainage may be remedied. Abstinence from the unauthorised administration of opiates to the child, and from the habitual indulgence in ardent spirits by the mother, is another point, much and generally insisted upon. Greater cleanliness, better nursing, and a warmer average dress, especially in winter, are other points of general hygienic importance much urged.

The particular suggestions made by several of the Fellows are many of them of considerable value, and will be found in the Transactions of the Society, Vol. xi.

Such are the most noteworthy and practical suggestions offered by those Fellows of the Society who responded to the invitation of the Council. It is evident, therefore, that, broadly speaking, a lessened infant mortality is to be sought, on the one hand, by an improved hygiene, and on the other, by an improved law.

The question of improved hygiene would include not only a well-weighed statement of the typical conditions of feeding, nursing, clothing, and generally caring for infants most favourable for their welfare, but also a consideration of the means best adapted to attain this end, such as the drawing-up and distribution of standard dietaries and printed rules as suggested by Dr. McVeagh and Mr. Heckford, and the regulated education of midwives as suggested by Mr. Hime, Dr. Yeaman, and others. And on this subject, probably, much unanimity would prevail among the Fellows of this Society. On the other question, that of an improved state of the law, more difference of opinion would probably exist not only as to the changes that may be desirable, but as to the best means of inducing the legislature to take action on the subject. Before, therefore, completing their report for Dr. Farr, the committee have thought it best to bring the subject before a meeting of the Society, that they may have the advantage of incorporating with their Report any remarks or suggestions with which they may now be favoured; and they do not hesitate to add that there are few subjects to which the Society could devote its attention and influence more usefully than that which forms the subject of the present inquiry.

APPENDIX TABLES.

TABLE 7. (continued).—Causes of Death registered in England in

Table with columns for CAUSES OF DEATH and years 1838-1856. Rows are categorized by Class (I, II, III) and Order (1-4). Includes various diseases like Erysipelas, Cholera, Typhoid, etc.

† Previously to 1847 deaths from puerperal fever were classed with deaths from childbirth; the numbers here given for each separately have

each of the 5 Years 1838-1842, and of the 25 Years 1847-1871.

1857	1858	1859	1860	1861	1862	1863	1864	1865	1866	1867	1868	1869	1870	1871	CAUSES OF DEATH.

For the four years 1843-46, both inclusive, debility were abstracted under one heading. In order, therefore, to establish something like uniformity in the above Table, the numbers against years, when they were separately classified. Between old age and senile debility a different system of classification was adopted in 1848 and is hence termed on the system described above. The numbers for the five years 1838-42.

TABLE 3.—Causes of Death registered in England in each of the 18 Years 1854-1871. To 1,000,000 PERSONS LIVING, the DEATHS from each CLASS of CAUSES, and from each CAUSE.

† In the years 1854-57 cases of so-called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "atrophy" and "debility" were thrown into one line. The figures for premature birth, and atrophy & debility, given in Table 7 on page 254-5, have been estimated for each year prior to 1868 from the proportion which the two headings bear to each other in the subsequent years when they were separately distinguished.

‡ For the years 1854-71 the deaths of which the cause was not specified have been distributed pro rata over all the causes in the Table.

TABLE 9.—Causes of Death in England in 1871. Proportional Numbers dying from each Class of Causes, and from each Cause.

Class.	1871		Class.	1871		Class.	1871		
	Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.		Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.		Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.

* Tables 19 and 20 are reprinted from "Annual Summary" for 1871.

TABLE 21.—Deaths and Death-rate from Heart Disease in England in the FOUR QUINQUENNIAL PERIODS between 1851 and 1870, and also in the Year 1871.

MALES.										
QUIN- QUENNIAL PERIODS.	DEATHS AT DIFFERENT AGES.					ANNUAL RATE PER 1000 LIVING.				
	All Ages.	0-20	20-45	45-65	65 and upwrds.	All Ages.	0-20	20-45	45-65	65 and upwrds.
1851-1855	32,617	4,416*	6,454†	11,873	9,874	·725	·177*	·553†	1·829	5·065
1856-1860	39,678	3,433	8,723	14,629	12,893	·836	·156	·529	2·137	6·268
1861-1865	49,738	3,942	11,128	18,662	16,006	·993	·169	·665	2·583	7·381
1866-1870	57,637	4,296	13,089	21,132	19,170	1·085	·174	·709	2·757	8·329
1871	12,911	925	2,981	4,773	4,232	1·164	·178	·788	2·968	8·603

FEMALES.										
QUIN- QUENNIAL PERIODS.	DEATHS AT DIFFERENT AGES.					ANNUAL RATE PER 1000 LIVING.				
	All Ages.	0-20	20-45	45-65	65 and upwrds.	All Ages.	0-20	20-45	45-65	65 and upwrds.
1851-1855	33,497	4,784*	6,719†	12,165	9,829	·713	·171*	·530†	1·780	4·232
1856-1860	41,095	3,610	9,349	14,930	13,206	·825	·164	·516	2·061	5·361
1861-1865	51,243	4,153	11,025	18,897	17,168	·970	·178	·573	2·454	6·568
1866-1870	60,003	4,632	12,711	21,588	21,072	1·067	·187	·621	2·632	7·574
1871	13,308	982	2,716	4,906	4,704	1·138	·189	·653	2·818	8·025

* These figures relate to the ages 0-25, as in the abstracts for the quinquenniad 1851-55 the deaths of persons aged 15-25 were classified together.

† These figures relate to the ages 25-45 for the five years 1861-65, as it is not possible to obtain separately the deaths of persons aged 15-20 and 20-25 during that quinquenniad.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.]

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted, the districts have this year (1871) been re-numbered consecutively from 1 to 627.*

For names of Towns, such as *Leamington, Torquay, &c.*, which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 261) and "Index of certain Towns" (page 271).

A

Aberayron, 600.
Abergavenny, 579.
Aberystwith, 601.
Abingdon, 114.
Alcester, 398.
Alderbury (Salisbury), 254.
Alnwick, 560.
Alresford, 104.
Alston, 565.
Alton, 105.
Altrincham, 447.
Alverstoke, 88.
Amersham, 139.
Amesbury, 253.
Amptill, 172.
Andover, 109.
Anglesey, 627.
Ashborne, 440.
Ashby-de-la-Zouch, 407.
Ashton-under-Lyne, 468.
Aston, 388.
Atcham (Shrewsbury) 351.
Atherstone, 390.
Auckland, 543.
Axbidge, 315.
Axminster, 269.
Aylesbury, 142.
Aylsham, 223.
Aysgarth, 537.

B

Bakewell, 442.
Bala, 620.
Banbury, 154.
Bangor, 625.
Barnet, 127.
Barnsley, 505.
Barnstaple, 285.
Barrow-upon-Soar, 409.
Barton-upon-Irwell, 464.
Basford, 431.
Basingstoke, 107.
Bath, 317.
Battle, 68.
Beaminster, 267.
Bedale, 535.

Bedford, 170.
Bedminster, 319.
Bedwelty, 580.
Belford, 561.
Bellingham, 558.
Belper, 439.
Berkhampstead, 138.
Berwick, 562.
Bethnal Green, 15.
Beverley, 518.
Bicester, 150.
Bideford, 287.
Biggleswade, 171.
Billericay, 190.
Billesdon, 403.
Bingham, 436.
Birkenhead, 454.
Birmingham, 387.
Bishop Stortford, 130.
Blaby, 404.
Blackburn, 474.
Blandford, 260.
Blean, 57.
Blofield, 228.
Blything, 216.
Bodmin, 294.
Bolton, 462.
Bootle, 573.
Bosmere, 211.
Boston, 418.
Bourn, 415.
Brackley, 155.
Bradfield, 117.
Bradford-on-Avon, 249.
Bradford (Yorkshire), 496.
Braintree, 199.
Bramley, 499.
Brampton, 567.
Brecknock, 604.
Brentford, 125.
Bridge, 55.
Bridgend, 586.
Bridgnorth, 348.
Bridgwater, 307.
Bridlington, 524.
Bridport, 268.
Brighton, 76.
Bristol, 320.
Brixworth, 161.
Bromley, 40.

Bromsgrove, 385.
Bromyard, 341.
Buckingham, 145.
Builth, 603.
Burnley, 472.
Burton-upon-Trent, 368.
Bury, 463.
Bury St. Edmunds, 206.

C

Caistor, 425.
Calne, 245.
Camberwell, 25.
Cambridge, 178.
Camelford, 290.
Canterbury, 56.
Cardiff, 583.
Cardigan, 597.
Carlisle, 569.
Carmarthen, 593.
Carnarvon, 624.
Castle Ward, 555.
Catherington, 102.
Caxton, 176.
Chapel-en-le-Frith, 443.
Chard, 309.
Cheadle, 366.
Chelmsford, 191.
Chelsea, 2.
Cheltenham, 335.
Chepstow, 577.
Chertsey, 30.
Chester, 452.
Chesterfield, 441.
Chester-le-Street, 549.
Chesterton, 177.
Chichester, 83.
Chippenham, 244.
Chipping Norton, 153.
Chipping Sodbury, 322.
Chorley, 475.
Chorlton, 465.
Christchurch, 92.
Church Stretton, 346.
Cirencester, 331.
Cleobury Mortimer, 347.
Clifton, 321.
Clitheroe, 473.

* Thus, the number of Marriages in the Aberayron District may at once be ascertained by referring to the "Abstract of Marriages," District number 600 (see page 24); and the numbers of Births and Deaths, of Deaths at different Ages, &c. will be found by referring to the same district number in the appropriate Tables.

Clun, 345.
 Clutton, 316.
 Cockermouth, 571.
 Colchester, 195.

INDEX OF SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (570; 2) is the 2d Sub-District of the Wigton District, No. 570.]

SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.

REGISTRAR-GENERAL'S THIRTY-FOURTH ANNUAL
REPORT AND APPENDIX.

	PAGES
AGES ; of Persons married in 1871	xi-xii
Mean Age at Marriage	xii
Deaths of Males and Females registered at different Ages in England in each of the Years 1838-71. (Tables 19, 20, pp. lxxviii- lxxix.)	xvii
Mortality of Males and Females at different Ages in England in the Years 1838-71. (Tables 21-24, pp. lxxx-lxxxiii.)	
of 270,028 Persons married in 1871, distinguishing Bachelors, Spin- sters, Widowers, Widows	26-28
at Death of Males and Females registered in 1871 in Divisions, Counties, and Districts	120-141
at Death of Males and Females in England registered from different Causes, in 1871	144-149
at Death of Males and Females in England registered from different Supplemental Causes, in 1871	150-153
at Death of Males and Females in London registered from different Causes, in 1871	154-159
 ALCOHOLISM. See Intemperance and Delirium Tremens.	
AMSTERDAM ; Mortality from all Causes in 1871	lv
AREA in Statute Acres of each Division, County, District, and Sub-district	30-84
of the sub-districts of London, <i>inclusive</i> and <i>exclusive</i> of Tidal Water (Table 34, p. xci.)	
ARMY ; Strength and Mortality in the Army at home and abroad. (Tables 48-54, pp. civ-cvi.)	xxiv
Average Strength of the British Army at Home in 1871. (Table 48, p. civ.)	xxiv
Mortality of the Army at Home in 1871. (Table 49, p. civ.)	xxiv
Average Strength of the British Army Abroad in each of the Years 1868-71. (Table 50, p. civ.)	
Number of Deaths in the British Army at Home and Abroad, 1868-71. (Table 51, p. cv.)	
Annual Rate of Mortality per 1000 amongst Officers and Men in the Army Abroad, 1858-71. (Table 52, p. cv.)	
Strength at Home and Abroad in 1861, showing the Numbers born in the different parts of the United Kingdom and elsewhere. (Table 53, p. cv.)	
Deaths of Officers and Men in Army Abroad belonging to Great Britain and to England and Wales, 1858-71. (Table 54, p. cvi.)	
Annual Rate of Mortality per 1000 in Great Britain, England, France, Austria, Prussia, and Italy, including the Deaths of Soldiers <i>at Home and Abroad</i> , 1857-71. (Table 60, p. cx.)	

AUSTRIA; Annual Rate of Mortality per 1000 in the Austrian Army, 1857-70. (Table 55, p. cvi.)	
Estimated Population in middle of the Years 1853-70. (Table 59, p. cx.)	
Annual Rate of Mortality per 1000, including Deaths of Soldiers at Home and Abroad, 1857-70 (Table 60, p. cx.)	
Number, and Proportion per 1000 of the Population, of Marriages, Births, and Deaths, in each of the Years 1853-70. (Table 61, p. cxi.)	
BERLIN; Weekly Returns for 1871 incomplete on account of the War	lv
BIRTHS in 1871	xv
of the two Sexes	xvi
out of wedlock, proportions in various counties	xvi
proportion of, in the different seasons	xvii
in quarter ending March 1871	xxviii
in quarter ending June "	xxxii
in quarter ending September "	xxxvii
in quarter ending December "	xliii
registered in England, in each Year, 1838-71. (Table 1, p. lx.) .	
proportion to Population in each Year, 1838-71. (Table 2, p. lxi.)	
Legitimate and Illegitimate in England in 1842 and in each Year 1845-71, and Proportion of Males to Females. (Table 10, p. lxix.)	
proportion of Illegitimate Children to every 100 Births in the several counties of England, 1852-71. (Table 11, p. lxx.)	
registered in England, and proportion to Population, in each Quarter of the Years 1838-71. (Table 12, p. lxxi.)	xvii
proportional Number of Births in each Quarter to 1,000 Births in the average Quarter, 1838-71. (Table 13, p. lxxii.)	
in Counties, in 1871. Numbers, Sex, Legitimate and Illegitimate; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 14, p. lxxiii.)	xv-xvi
proportion of Male and Female Children born in the several Counties of England during each of the Years 1861-71. (Table 15, p. lxxiv.)	
proportion to Population in Counties for each of the Years 1861-71. (Table 16, p. lxxv.)	
registered in each of the Divisions, Counties, Districts, and Sub-districts in 1871, distinguishing Males and Females	30-84
excess of, over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1871	30-84
registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1871	86-89
of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1871	90-93
BIRTH-RATE in England, 1851-60, 1861-70, and in 1871	xv
in England in each Quarter of the Years 1838-71. (Table 12, p. lxxi.)	
in Counties in each of the Years 1861-71. (Table 16, p. lxxv.)	
BOMBAY; Deaths, &c. in 1871	lv
BRONCHITIS; Mortality from	222
BURNS AND SCALDS; Deaths and Mortality at different Ages, in the Years 1848-67, and in each of the Years 1868-71. (Table 16.—App.)	251

	PAGES
CALCUTTA; Population; Deaths from All Causes and from Remittent Fever in 1871	iv
CAUSES OF DEATH of Males and Females in England, at different Periods of Life, in 1871	144-149
(Supplementary Table) of Males and Females in England, at different Periods of Life, in 1871	150-153
of Males and Females in London at different Periods of Life, in 1871	154-159
of Males and Females in England, and in each of the Divisions and Counties, in 1871	160-183
(from certain zymotic and other Causes) in 1871, in the Divisions, Counties, and Districts of England	184-195
Dr. Farr's Letter to the Registrar General thereon (with Supplement on Infant Mortality)	219-229
registered in England in each of the Five Years 1838-42, and in the 25 Years 1847-71. (Table 7.—App.)	234-239
Mortality from, to 1,000,000 persons living, in each of the Years 1854-71. (Table 8.—App.)	240-242
proportional Numbers dying from each Cause in 1871. (Table 9.—App.)	243
Mean Annual Rate of Mortality from different Causes during the 20 years 1850-69, and in each Decade and Quinquennium of that period; in 1870, and in 1871. (Table 10.—App.)	244-247
in England, in 1871, arranged in the order of their fatality. (Table 11.—App.)	248
CENTENARIANS; deaths of reputed (Table 18, p. lxxvii.); Number said to be living at Census of 1871	xviii-xix
CHILDBIRTH; excessive number of Deaths from	223
Deaths in 1871, at different Ages, of Women after Childbearing, classed under different Diseases, and neither referred to Childbirth nor to Metria in the Abstracts. (Table 12.—App.)	249
Deaths of Women in 1871 who were returned as pregnant, classed under certain Diseases. (Table 13.—App.)	250
Deaths of Women from Metria and Childbirth in the 25 Years, 1847-71, and proportional Deaths of Mothers to 10,000 Children born alive. (Table 14.—App.)	250
CHILDREN; Causes of death of, under one year of age	223
Mortality of, in England as compared with other Countries	223
Treatment of, at and after birth in England and other Countries	223-224
Report of Committee of the Obstetrical Society on Mortality and Treatment of (1870)	225-229
CHOLERA: The epidemic of 1866 the probable cause of the large number of Deaths from Diarrhea	222
CONSTITUTIONAL DISEASES	222
CYNANCHE MALIGNA and DIPHThERIA; Deaths in England at different Ages in each of the Years, 1855-71. (Table 1.—App.)	230
DEATHS in 1871	xvii
excess of Births over	xvii
proportion to Population	xvii
of the two Sexes at different ages in 1871 and 1861-70	xvii-xviii
Mortality at different Ages of Males and Females	xvii-xviii
of reputed Centenarians	xviii

REPORT

TO

The Right Honourable GEORGE SCLATER-BOOTH, M.P.,
President of the Local Government Board, &c. &c.

*General Register Office, Somerset House,
7th July 1874.*

(1872.)

SIR,

I HAVE the honour to submit to you my Report on the Registration of Marriages, Births, and Deaths for the year 1872.

The registers have all been carefully examined and revised at this office, and I am now able to report very accurately the numbers of marriages, births, and deaths registered during the year. The marriages and the births exceed the numbers recorded in any previous year; and, after allowing for increase of population, their rates are considerably above the average. The rate of mortality was below the average.

As for legal as well as statistical purposes, it is important that these three facts in the life of the people should be all authentically registered, I propose to state here to what extent, in my belief, that result is achieved; and to what causes any existing imperfection is due. All the marriages, since the date of Lord Hardwick's Act,* have been registered in England; and there is no reason to believe that the registers of the last year were incomplete. Not so the births. The Act of 1836† lays it down in clause 19, that the parent of a child, or the occupier of the house in which a child was born, "MAY *within forty days give notice of the birth to the Registrar*"; and in clause 20 enacts, that the parent or occupier shall give the required information, *on being requested so to do by the Registrar*. It was not enacted that the persons who best know shall give the information; and there is no punishment for the neglect; no penalty for refusal. Any one who has administrative experience will see the difficulty of working such an enactment. How can a Registrar who is paid a shilling a case for every birth registered ascertain the occurrence of every birth, legitimate or illegitimate, in every house, in every street of London? In other large towns, or in wide districts, the Registrars encounter similar, or equal difficulties. I have urged the Registrars, through my Inspectors, to adopt the most effective means for getting information from all sources, and it is gratifying to me to state that through their exertions, with the assistance of the enlightened part of the public, the number of births that escape registration has constantly declined. The precise extent of the deficiency cannot be determined; but I am disposed to believe that the annual deficiency in the last ten years does not exceed the estimate in the last Census Report,‡ and that was 13,614 out of 763,623. The probable annual deficiency in the ten years 1841-50 was 38,036, in the next ten years 19,323, and in the last ten years, as has been already shown, 13,614. The deficiency thus rapidly declined: calculated on 1000 births occurring, it was in the three decades, 65 in the first, 29 in the second, and 18 in the third. I have no hope of effecting the

* 26 Geo. 2. c. 33.—1753.

† 6 & 7 Will. 4. c. 86, clauses 19, 20.

‡ Vol. 4. Appendix A., p. 55.

registration of all the births until the Legislature arms me with the power of carrying out the intentions of the Act under the pressure of a penalty clause, which in practice would rarely or ever after the first year have to be enforced. If every parent of a child were directed to give early information of its birth to the Registrar, and subjected to a penalty for neglecting this duty to the child and to the State, I confidently believe that few births would escape registration. The record would be complete; the missing links in pedigrees would be reduced to a minimum; children would be under the protection of the law, and they would no longer be under the many disadvantages arising from inability to prove their age and parentage, by a birth certificate.

I have reason to believe that a certain number of children born alive are buried as stillborn, and that of deaths buried without a Registrar's certificate a few are never registered. The officiating clergyman is bound in every such case to give notice of the burial to the Registrar of the sub-district in which the death occurred; but this is not, for various causes, invariably done.

The causes of death are certified on forms which I supply, in the great majority of cases by the medical attendants of the deceased or by the coroners; but I ascertained in the year 1871 that in about 8 per cent. of the deaths the cause was not certified by a qualified practitioner. A certain small number of medical practitioners refuse to fill up the certificates for various reasons; in about 2 per cent. of the cases there was no medical attendant; and in the residue of the cases the sick children and adults were attended by chemists and druggists, by herbalists, by bonesetters, by quacks, and by various orders, of unqualified people. In a considerable number of sub-districts every death is certified; in a few sub-districts, especially of Wales and Cornwall, the certificates fall to a very low proportion.

I am of opinion that the grant of the certificate, which is now voluntarily given by the great majority of practitioners, should be rendered compulsory to meet the exceptional cases, and that some means should be adopted to secure the best returns of the cause of death procurable in every case. While asking power to meet exceptional cases I feel bound to express my thanks to the College of Physicians and to the medical profession generally for their friendly co-operation in carrying out the Act.

Increase of Population.—From the rate of increase observed in the thirty years 1841–71, the population of England and Wales enumerated on 3d April 1871 is estimated—by the middle of 1872—to have increased to 23,067,835.

The estimated population at the middle of 1871 was 22,782,812, so the estimated increase from the middle of 1871 to the middle of 1872 was 285,023.

The *natural* increase of population as represented by the excess of births over deaths, in the year ending 31st December 1872, was 333,642; but this number will always be in excess of the *actual* increase of population owing to the outflow by emigration.

295,213 emigrants left the ports of the United Kingdom, at which there are Government Emigration Officers, in the year 1872, including 120,780 English, 19,918 Scotch, 73,959 Irish, and 80,556 Foreigners. 5,696 emigrants whose birthplaces were not stated are proportionally distributed in this statement. Deducting the English emigrants from the *natural* increase of population, a balance of 212,862 remains to which a certain proportion of emigrants from Scotland, Ireland, and other parts must be added in order to obtain the *true* increase of population.

It had not been observed before that great numbers of the emigrants to the colonies, and to the United States return to England until this was proved in the Census report of 1871. The numbers of returning emi-

grants in the ten years 1861-70 were estimated at 251,984. Upon inquiry after this estimate was made, the fact that great numbers returned to England was proved by information in the possession of the Emigration Commissioners. Something of the same kind was going on in 1872 but probably not to the same extent.

The emigration Reports show that there has been a large increase in the number of *English* emigrants during the last four years, as will be seen by reference to the annexed Table showing the nationality of the emigrants from the United Kingdom during the last ten years :—

YEARS.	English.	Scotch.	Irish.	Foreigners.	Not distinguished.	Total.
1863	61,243	15,290	116,391	7,833	23,061	223,758
1864	56,618	15,085	115,428	16,942	4,577	208,900
1865	61,345	12,870	100,676	23,619	6,291	209,801
1866	58,856	12,307	98,890	26,091	3,138	204,882
1867	55,494	12,563	88,622	31,193	7,778	185,953
1868	58,268	14,954	64,965	51,956	6,182	196,325
1869	90,416	22,559	73,325	65,752	5,975	258,027
1870	105,203	22,935	74,283	45,396	6,033	255,940
1871	102,452	19,232	71,067	53,246	6,438	252,435
1872	118,190	19,541	72,763	79,023	5,696	295,213
Total in } 10 Years }	768,175	167,529	876,410	409,651	80,469	2,302,234

In proportion to population the number of Irish emigrants is greater than the English or Scotch, but it is worthy of notice that previous to 1869 the *absolute* number of Irish emigrants had exceeded the English, whereas, in each of the years 1869-72 the reverse was the case.

The number of Foreign emigrants—chiefly Germans, Norwegians, and Swedes, passing through this country on their way to the United States and to British North America, has rapidly increased; in 1864 they numbered 17,347, whereas in 1872 they amounted to 80,556, or 27 per cent. of the total number of emigrants who left the Ports of the United Kingdom at which there are Emigration Officers. The war between Germany and France appears to have affected the numbers in 1870.

Meteorology.—The most remarkable feature of the year 1872 was the excessive rain-fall. The land during the last three months of the year was for a time thoroughly washed and purified, and this almost unprecedented fall of rain has in many ways been most beneficial. The mortality was sensibly less than in the two previous years of severe and partial drought. The total fall of rain was enormous, and each of the last three months showed an excess. During the quarter rain had fallen at Greenwich on 67 days, a greater number than had been previously experienced as far back as the year 1815. The total fall in the 67 days amounted to 11·32 inches. The previous instances of large falls at Greenwich were as follows :—

YEAR.	Amount fallen.			Total Fall in the Quarter.	Number of Days of Rain in			The Quarter.
	Oct.	Nov.	Dec.		Oct.	Nov.	Dec.	
	in.	in.	in.	in.				
1821	2'43	4'83	4'72	11'47	11	20	19	50
1822	3'00	3'06	2'26	9'52	12	16	6	34
1824	2'44	3'88	3'55	9'87	12	14	17	43
1831	3'65	2'70	3'47	9'82	19	15	19	53
1832	4'41	4'48	2'08	10'97	16	15	16	47
1833	2'87	2'51	4'95	10'33	13	11	27	51
1841	5'84	2'75	1'92	10'51	22	13	18	53
1844	4'01	4'74	0'34	9'09	15	13	6	34
1852	3'75	5'06	1'72	11'13	15	22	19	56
1865	5'90	2'39	0'87	9'16	19	18	10	47
1868	2'59	1'16	5'45	9'20	13	19	23	48
1872	4'88	2'92	4'07	11'82	22	24	21	67

It has been shown* that an inch deep of rain weighs nearly 101 tons per acre. For every 100th of an inch, therefore, upwards of a ton of water falls. The rain-fall registered at Greenwich was 11.32 inches, so that upwards of 1100 tons of water fell in the last three months of the year on each of the 37,000,000 acres of England and Wales. It is known that the rain-fall in the greater part of England exceeds the amount registered by the Astronomer Royal; so that this is the minimum quantity that fell. The rain-fall of the year at Greenwich was 30 inches.

The mean temperature of the year at the Royal Observatory, Greenwich, was mild, being 50°.7, or 1°.3 above the average. The meteorology of the year is ably described by Mr. Glaisher, F.R.S., in his remarks on pp. lvii-lix. See also Tables, pp. xcvi-c.

Prices.—Owing to the frequent fluctuations and severity of the weather throughout the concluding months of the year 1871, and to the heavy rains in the autumn of 1872, which damaged the cereal crops, the yield of the harvest of 1872 was below the average. The weather was also more unfavourable to the potato plant than in any year since 1846-8, and the crop largely failed: the wholesale price of potatoes, which was 77s. per ton in 1871, rose to 131s. 6d. per ton in 1872, representing an increase of 71 per cent.

The official returns show an increase in the number of cattle and sheep, but the foot and mouth disease, and pleuro-pneumonia were unprecedently virulent in all parts of the country, and rinderpest broke out in the autumn. Towards the close of the year, however, there was an abatement of these diseases, attributed by some authorities to measures of repression, and by others to the beneficial action of the excessive rain-fall on the soil and atmosphere.

There was a great advance in the price of butchers meat in the three years 1869-71, and in 1872 it was still very high. Beef, as sold by the carcase at the Metropolitan meat market, ranged from 5½d. per lb. for inferior quality to 7¾d. for superior quality. Mutton was from 6d. per lb. for inferior quality to 8¾d. for superior quality. Beef was at the same price as in 1871, but mutton was dearer, indeed, the price of mutton of superior quality was exorbitant, for it was 8¾d. per lb.

In the five years 1852-56 the average price of beef was about 5½d. per lb., of mutton 5½d. per lb. In the five years 1868-72, both beef and mutton were 1d. per lb. dearer, representing an increase in the price of the former of 19 per cent., and of the latter of 18 per cent.

The great increase in the supply of gold during the last quarter of a century has resulted in its depreciation, or in other words, in a general rise in prices. The changes that have been brought about by the somewhat rapid rise in prices and wages in 1872 is one of the most remarkable events of the year. The connection of these economic phenomena with the annual numbers of marriages and births, and with the public health, must be carefully observed.

Pauperism.—The effects of general prosperity and abundant employment are visible in the returns of pauperism for the year. The report of the Local Government Board shows a material decrease in the pauperism of the country. From a return showing the number of paupers—exclusive of lunatics in Asylums and vagrants—it appears that on the last day of the last week in 1871 there were 930,902 paupers including 150,093 in-door, whereas on the corresponding day of 1872 there were only 838,636 paupers, including 147,657 in-door, showing a decrease of 92,266, or 9.9 per cent. in 1872.

The average number of paupers receiving relief on the last day of each week amounted to 137,278 in-door, and 714,970 out-door, against 143,605 in-door, and 803,797 out-door in the previous year.

* See Registrar General's Weekly Return, No. 5, 1865.

MARRIAGES.

The year 1872 is remarkable as a year of defective harvest, cattle-plague, excessive rain-fall, rise in the price of coal and iron, and rise in the prices and wages of labour. The price of wheat was high, viz., 57s. 1d. per quarter, the average price in the ten years 1862-71 being 51s. 2d. per quarter; and there was a general rise in the price of various commodities, but as a set-off against the general and rapid rise of prices, the working classes found full employment at good wages, and, confirmatory of previous experience, the prosperity of the people expressed itself in an increased marriage-rate. The country, therefore, may now be said to have recovered from that commercial depression which began in 1866-7, and which had the effect, as shown in the annexed figures, of depressing the marriage-rate, more or less, in each of the five years 1867-71:

Years.	Persons married to 1000 persons living.		
1866	-	-	17·5
1867	-	-	16·5
1868	-	-	16·1
1869	-	-	15·9
1870	-	-	16·1
1871	-	-	16·7
1872	-	-	17·5

In the year 1872, 201,267 marriages were celebrated, so 402,534 persons were married, a number considerably in excess of those in any previous year, and 22,310 more than in 1871. The marriage-rate (persons married to 1000 population) was 17·5, or 1·0 above the mean of the last thirty-five years, and 0·8 above the rate in 1871.

Comparing the marriages in 1872 with the mean number in the ten years 1862-71, the increase, in proportion to population, is found to be greatest in the manufacturing counties, and in the counties where the iron and coal districts abound. Thus the mean rate in the ten years and the rate in 1872, respectively, in each of the undermentioned counties was as follows:—Northampton 14·7 and 17·5, Stafford 16·9 and 19·5, Warwick 16·2 and 18·4, Nottingham 16·4 and 19·8, Derby 15·5 and 17·0, Chester 16·0 and 17·0, Durham 17·1 and 19·7, Northumberland 18·9 and 21·0, Monmouth 17·1 and 20·4, Cumberland 15·1 and 16·8, Westmorland 13·6 and 14·4, Lancaster 18·8 and 20·6, South Wales 16·1 and 17·8. In the counties of Kent (extra-metropolitan), Sussex, Wilts, Dorset, and Hereford, the rates exhibit a striking decrease.

Forms of Marriage.—Of the 201,267 marriages, 152,364, or 76 per cent., were solemnized according to the rites of the Established Church, and 48,903, or 24 per cent., were performed *not according* to its rites. In the five years 1841-45, as shown in my last Report, the proportions were 92 and 8 per cent. respectively. This decrease in the numbers married according to the rites of the Established Church is chiefly accounted for by the large and increasing number who avail themselves of the form of marriage at the Superintendent Registrars' Offices without religious rites.

In August 1836, by the Act 6 & 7 William 4. c. 85, it was enacted that all places of religious worship "may be registered for solemnizing marriages therein," and by the end of the next year (1837) 946 buildings were registered for this purpose, 396 in the following year, 221 in 1839, and 181 in 1840, until in the year 1855 (when only 98 buildings were registered) the number on the register amounted to 3658.

In July 1855, by the Act 18 & 19 Vict. c. 81, entitled An Act to amend the law concerning the certifying and registering of places of religious worship in England, it was enacted that "all places of religious worship, not being churches or chapels of the Established Church, should, if the congregation should desire but not otherwise, be certified to the Registrar General."

Many places were in consequence certified for public worship, which is a necessary preliminary to registration for the solemnization of marriages. The passing of this Act appears to have led to a striking increase in the number of buildings annually registered for the solemnization of marriage, as is seen in the following table :—

YEARS ending 31st Dec.	Number Registered less Cancellations each Year.	Number on the Register each Year.	YEARS ending 31st Dec.	Number Registered less Cancellations each Year.	Number on the Register each Year.
1837	946	946	1855	98	3658
1838	396	1342	1856	153	3311
1839	221	1563	1857	114	3225
1840	181	1744	1858	147	4073
1841	120	1864	1859	156	4228
1842	119	1983	1860	175	4403
1843	160	2143	1861	161	4564
1844	160	2303	1862	190	4754
1845	164	2467	1863	200	4954
1846	148	2615	1864	209	5163
1847	123	2738	1865	189	5362
1848	131	2869	1866	224	5576
1849	125	2994	1867	204	5780
1850	112	3106	1868	212	5992
1851	122	3228	1869	220	6212
1852	112	3340	1870	213	6425
1853	113	3453	1871	215	6640
1854	107	3560	1872	264	6904

Thus the number of places of worship where marriages can be solemnized—not connected with the Establishment—increased, and the number of marriages performed not according to the rites of the Established Church also increased proportionately.

Of 100 couples who married in 1872 according to the rites of the Church 101 married by special licence, 11 by licence, 85 after banns, and 3 by Superintendent Registrar's certificate, while in nearly 1 per cent. the clergy omitted to state under which of the foregoing heads the marriages should be classed. Of 100 couples who married not according to the rites of the Church 17 were Roman Catholics, 41 were members of various Christian denominations, 1 Quakers, 9 Jews, and 41 were married at Superintendent Registrars' Offices.

Marriages according to Quaker rites are decreasing, and the numbers in the last five years were 73, 50, 48, 53, and 44. The marriages among

Jews have increased; the numbers in each of the last five years were 306, 336, 358, 396, and 428.

First Marriages; Re-marriages.—Of the 201,267 marriages in 1872, 164,589 were between bachelors and spinsters. 47,359 persons were married who had been previously wedded. Of the 27,534 widowers who re-married, 16,853 married spinsters, and 10,681 married widows; while of the 19,825 widows who re-married, 9,144 were espoused by bachelors, and 10,681 by widowers. Thus there is an evident tendency in widowers and widows to intermarry. Of every 100 men married in the year 1872 13·7, and of every 100 women 9·9, had been previously married.

The registers of marriage at the central office show that the number of marriages of divorced persons in 1872 was 58, viz., 56 in which one or other of the contracting parties is stated to have been previously divorced, and 2 in which divorced men married divorced women. Of 28 divorced men who re-married, 22 married spinsters, 4 married widows, and 2 married divorced women. Of 32 divorced women who re-married, 21 were married to bachelors, 9 were married to widowers, and 2 were married to divorced men.

The proportional number of *divorced persons* who re-married to every 10,000 persons married was ·61 in the four years 1861–4, 1·00 in the four years 1865–8, and 1·29 in the four years 1869–72.

Ages at Marriage.—The ages of the existing married and unmarried population combined with the ages at marriage furnish the means of determining several very important social questions, and the recent enumeration of the ages and conjugal condition of the people enabled us to show, in the report on the recent Census, that the probable duration of the joint lives of husband and wife in England and Wales was 27 years, and that the probable duration of the longest life was 48 years.†

The proportion of children to a marriage is, to a great extent, dependent on the age at which marriage is contracted, and the marriage registers of a nation furnish the means of determining this age. In England and Wales of 201,267 marriages-registered in 1872 the ages of both parties were specified in 145,507 instances, about five sevenths of the total number. The mean age at marriage of these 145,507, including the re-married, was 27·9 years for men, and 25·7 years for women.

The proportion of young people who marry has never been so high as during the year under review, and the proportion has been gradually increasing since the commencement of registration. In 1851 in every 100 marriages 5·02 men and 15·75 women were under 21 years of age, while in 1872, 8·00 of the men and 22·32 of the women were minors, but this increasing tendency to early marriage has not affected the mean age at marriage to any appreciable extent, for while the mean age of bachelors in 1851 was 25·8 years, and of spinsters 24·6 years, the ages in 1872 were nearly the same, viz., 25·7 and 24·3 years.

By means of the Census returns relating to the ages and conjugal condition of the people, I am enabled to show the annual rate of marriage at each year of age under 21, in each of the three periods 1850–52, 1860–62, and 1870–72.

* The number of decrees of divorce pronounced by Her Majesty's Court for Divorce and Matrimonial Causes in the year 1872 was, nisi 107, absolute 133.

† See Census of England and Wales, Vol. IV. General Report, pp. xvii–xx, where it is also shown that the mean age of the married population being 41·85 years, and the mean age at marriage 26·70 years, the mean natural term of existing married life is rather more than the difference between these two results (15·15), viz., 17·63 years.

Marriages.

TABLE A.—England. Number of Bachelors, Spinsters, Widowers, and Widows at each Year of Age under 21 living in 1851, 1861, and 1871; also the Numbers and Proportions who were Married Annually in each of the THREE PERIODS 1850-52, 1860-62, and 1870-72.

20 & under 21	5.226	4.626	5.226	10.200	8.833	10.204

The Table may be read thus:—In 1851 there were 1,121,155 Bachelors, 188 Widowers, (1,121,343 Unmarried Men,) 1,094,588 Spinsters, 671 Widows, (1,095,259 Unmarried Women,) aged 15 and under 21. The average annual numbers Married in the 3 years 1860-62, aged 15-21, were 10,801 Bachelors, 8 Widowers, (10,809 Men), 32,389 Spinsters, 50 Widows, (32,439 Women,) being in the proportion of .946 Bachelors to every 100 living, 4.255 Widowers, (Men Married to every 100 Unmarried Men, .946,) 2.959 Spinsters to every 100 living, 7.452 Widows, (Women Married to every 100 Unmarried Women, 2.962).

* The Population at the above Ages has been deduced from the graduated Tables showing the estimated numbers living at each year of age, published in each of the Census Reports of 1851, 1861, and 1871.

† In a certain number of cases the Age at Marriage is not returned; for example: the average annual number of Minors married in the 3 years 1870-72 was 14,288 Men and 41,978 Women, but an abstract of the instances in which the ages of both parties were stated only produced 13,621 Men and 35,722 Women; the ages of one or both of the couples married in the other cases being distinguished in the marriage registers by the terms "Minor," "Under Age," &c. The numbers of Men and Women whose ages were not stated have been proportionally distributed over the different periods of age.

To ascertain the increased disposition to early marriage more accurately the number of unmarried women living under 21 years of age at different periods must be taken into account. This has been done in Table A., and by dividing the average annual marriages of minors by the numbers unmarried at corresponding ages, the result shows that, among men under 21 years of age, marriage was contracted by 7.6 in 1000 living in 1850-52, by 9.5 in 1860-62, and by 11.8 in 1870-72; and that early alliances among women under 21 years of age were contracted by 24.3 in 1000 in 1850-52, by 29.6 in 1860-62, and by 34.1 in 1870-72.

There is therefore, beyond doubt, an increasing tendency to early marriage among the young people of this country.

The proportion which the population, including the army, navy, &c. abroad, at the ages 15 and under 21 bore to the population aged 15 and upwards at each of the three Censuses of 1851, 1861, and 1871 was 18.38, 17.93, and 17.90 per cent., respectively.

Widowers are more inclined to marry than bachelors. By the annexed Table B., showing the average annual rate of marriage in the three years 1870-72 at each of 14 periods of age, it will be observed that this disparity of disposition is most remarkable in old widowers and old bachelors. At ages 35-40, to every bachelor who married 4 widowers remarried; at ages 40-45, 5 widowers remarried to every bachelor who married. As age advances this disparity increases, and at ages 50-55 the relative proportions were 1 bachelor to 7 widowers; at 60-65, 1 bachelor to 8 widowers; and at 65-70, to every bachelor who married 8 widowers remarried. These are marriages out of equal numbers.

Widows also marry in higher proportions than spinsters, thus at ages 15-20, to every spinster who married 2 widows remarried; at ages 20-25 and 25-30 the disparity was not so great, but at ages 30-35, and up to 65, the relative proportions were about the same as at ages 15-20, for to every spinster who married 2 widows remarried.

TABLE B.—England and Wales. Number of Bachelors, Spinsters, Widowers, and Widows at DIFFERENT AGES who were ENUMERATED at the CENSUS of 1871; also the Average Annual Numbers and Proportions who were MARRIED in the THREE YEARS 1870-72.

NOTE.—Of the average annual number of marriages in the three years 1870-72, the ages of the males and females were stated only of the following numbers; viz., 118,671 bachelors, 123,624 spinsters, 17,188 widowers, and 12,430 widows. In this Table these numbers have been proportionally raised to the total numbers married under the respective classes.

Signature of Marriage Registers.—Now that so much progress has been made in meeting the educational wants of the country, the number of men and women who sign their names in the marriage register will be regarded with increasing interest.

Of the 201,267 marriages in 1872, 39,125 men, or 19·4 per cent., and 52,920 women, or 26·3 per cent., made marks in signing the marriage register, so that only 80·6 per cent. of the men, and 73·7 per cent. of the women who married wrote their names. These results show that out of every 100 marriages, 13·3 men, and 22·5 women, were able to write their names in excess of the numbers in 1841, 30 years previously. The disparity between the number of men and women able to write, though not so great as in former years, is still striking. The ability of the men to write has increased during the last 31 years at the rate of 20 per cent., while that of the women has increased 44 per cent.

The returns of future years will, it may be hoped, afford evidence of still more satisfactory progress, so that the great body of the people of England may no longer lag behind the people of Scotland in elementary education.

Turning to the report of the Registrar General for Scotland just published, relating to the abstracts of 1870, the advantages of the old Scotch system of education over that of England are still apparent. 90 per cent. of the men who married, and 80 per cent. of the women who married in Scotland, signed their names in writing, whereas in England and Wales in 1872 the proportions per cent. who signed in writing were 81 for men, and 74 for women.

The proportions in the different counties and districts show where educational efforts should be more particularly directed. In the counties containing the great centres of mining and manufacturing industries, the proportion of *women* unable to sign was very high; in Lancaster only 62·1 per cent. were able to write their names, in Bedford 64·0, North Wales 64·1, Durham 64·8, West Riding of York 66·2, Cornwall 69·7, Chester 70·1, Nottingham 70·1, Salop 70·6. In some parts little more than half of the *women* who married were able to write, the proportions per cent. being 57·4 in Stafford, 57·6 in Monmouth, and 54·3 in South Wales.

The counties where educational efforts for *men* claim most attention are Monmouth, where the proportion per cent. who signed in writing was 62·6, Stafford 64·0, Bedford 68·9, Hertford 70·2, Suffolk 70·9, South Wales 71·3, Norfolk 72·1, North Wales 72·5, Salop 72·6, Cambridge 73·4, Hereford 75·0, Cornwall 75·7, Hunts 76·2, Wilts 76·4, Bucks 77·1, Durham 77·1, Worcester 77·1, Dorset 77·9, Nottingham 78·1. In London the proportion for men was 91·2, for women 86·1.

Buildings registered for Marriages.—The number of these buildings registered in 1872 was 264, bringing up the total number on the register at the end of the year to 6904. Of the 264 registered during the year 3 belonged to Presbyterians, 38 to Independents, 42 to Baptists, 1 to the United Brethren or Moravians, 20 to Roman Catholics, 6 to Unitarians, 111 to the various sects of Wesleyan Methodists, 14 to Calvinistic Methodists, 1 to the Countess of Huntingdon's Connexion, 2 to the Catholic and Apostolic Church, and 26 to other places of worship. For the distribution of the 6904 buildings now on the register, under the various denominations, see Table 9.

Certified Places of Worship.—The number of places of meeting certified for religious worship during the year 1872 not being churches or chapels of the Established Church was 607. The number on the register on 31st December 1872 was 19,134. The following is a list of the various titles by which religious denominations have been certified to the Registrar General. The names printed in italics have been added since the publication of the list in the last Report.

- Advents.
- Apostolics.
- Armenian New Society.
- Baptists.
- Baptized Believers.
- Believers in Christ.
- Bible Christians.
- Bible Defence Association.
- Brothron.
- Calvinists.
- Calvinistic Baptists.
- Catholic and Apostolic Church.
- Christadelphians.
- Christians who object to be otherwise designated.
- Christian Believers.
- Christian Brethren.
- Christian Eliasites.
- Christian Israelites.
- Christian Mission.
- Christian Testotallers.
- Christian Temperance Men.
- Christian Unionists.
- Church of Scotland.
- Church of Christ.
- Church of the People.
- Church of Progress.
- Countess of Huntingdon's Connexion.
- Disciples in Christ.
- Disciples of Jesus Christ.
- Eastern Orthodox Greek Church.
- Electics.
- Episcopalian Dissenters.
- Evangelical Unionists.
- Followers of the Lord Jesus Christ.
- Free Catholic Christian Church.
- Free Christians.
- Free Christian Association.
- Free Church.
- Free Grace Gospel Christians.
- Free Gospel and Christian Brethren.
- Free Gospel Church.
- Free Church (Episcopal).
- Free Church of England.
- Free Union Church.
- General Baptist.
- General Baptist New Connexion.
- German Lutheran.
- German Roman Catholic.
- Glassistes.
- Glory Band.
- Greek Catholic.
- Hallelujah Band.
- Independents.
- Independent Religious Reformers.
- Independent Unionists.
- Inghamites.
- Israelites.
- Jews.
- Latter Day Saints.
- Modern Methodists.
- Moravians.
- Mormons.
- New Connexion Wesleyans.
- New Jerusalem Church.
- New Church.
- Old Baptists.
- Original Connexion of Wesleyans.
- Orthodox Eastern Church.
- Particular Baptists.
- Plymouth Brethren.
- Peculiar People.
- Presbyterian Baptist.
- Presbyterian Church in England.
- Primitive Methodists.
- Progressionists.
- Protestant Members of the Church of England.
- Protestants adhering to Articles of Church of England, 1 to 18 inclusive, but rejecting Order and Ritual.
- Providence.
- Quakers.
- Ranters.
- Reformers.
- Reformed Presbyterians or Covenanters.
- Recreative Religionists.
- Refuge Methodists.
- Reform Free Church of Wesleyan Methodists.
- Revivalists.
- Revival Band.
- Roman Catholics.
- Salem Society.
- Sandemanians.
- Scotch Baptists.
- Second Advent Brethren.
- Separatists (Protestant).
- Seventh Day Baptists.
- Society of the New Church.
- Spiritual Church.
- Strict Baptists.
- Swedenborgians.
- Temperance Methodists.
- Testimony Congregational Ch.
- Trinitarians.
- Union Baptists.
- Unionists.
- Unitarians.
- Unitarian Baptists.
- Unitarian Christian.
- United Christian Church.
- United Free Methodist Church.
- United Brethren or Moravians.
- United Presbyterians.
- Welsh Calvinistic Methodists.
- Welsh Free Presbyterians.
- Wesleyans.
- Wesleyan Methodist Association.
- Wesleyan Reformers.
- Wesleyan Reform Glory Band.
- Working Man's Evangelistic Mission Chapels.

BIRTHS.

The births registered during the year 1872 amounted to 825,907, and exceeded by 28,479 the births during the previous year. Allowing for increase of population, the birth-rate per 1000 of population was 35·8, or 1·9 above the mean of 35 years. The number of births has never been so high as it is in the year under review, and, with the exception of the year 1868, the proportion to the population has never been so high.

The increase in the rate from 31·6 per 1000 of population, or one birth to every 32 persons living in the five years 1838-42, to 35·3, or one birth to every 28 persons living in the five years 1868-72, is in some measure due to the progress of registration. In former years the birth-rate of England was less, but during the last six years the birth-rate of England has been higher, than that of Scotland, as shown in the annexed statement.

Births to 1000 persons living.

Years.	England.	Scotland.
1867	35·4	35·1
1868	35·8	35·3
1869	34·8	34·3
1870	35·2	34·6
1871	35·0	34·5
1872	35·8	35·0

By the operation of a clause in the Scottish Registration Act registration of both legitimate and illegitimate births within 21 days after birth is enforced by a penalty not exceeding 20s., the penalty not being exacted in cases where it is proved that the neglect to register did not arise from wilful failure. As regards the English Act, the provisions for the registration of births are rather voluntary than compulsory.

A certain proportion of the births that escape registration in England are doubtless illegitimate; but it is to be feared that some thousands of legitimate births also escape registration every year, and I have no expectation of being able to secure the registration of every birth until the parents or other qualified informants are bound under penalties to give the Registrar notice.

On account of the interference of emigration and immigration it is difficult to determine accurately the number of births that escape registration, but it was estimated in the Census Report at 13,614 annually in the 10 years 1861-70.

As noted in previous years, the highest birth-rates, in 1872, are observed in the counties of Durham and Stafford, the proportion of births to 1000 of population being 44·0 and 41·9 respectively; the lowest rates, excluding Rutland, where the facts are few, are recorded in the counties of Devon (30·4), Dorset (30·5), and Hereford (30·6).

The recent Census returns confirm previous deductions, and show that counties with a high proportion of married women at the child-bearing ages have the highest birth-rate; thus of every 100 women living at the ages 15-45 in Durham, 59·9 were married, and in Stafford 56·3, while in Devon the proportion was only 45·2, in Dorset 47·0, and in Hereford 47·3. Of every 100 women living in England and Wales, at the ages 15-45, 49·6, nearly half the number, were married.

The Appendix to the Census Report of 1871 contains some interesting results bearing upon this point,* and shows that in the counties containing the agricultural districts the birth-rate is generally low, while in those counties where the great mining industries of the country are carried on the birth-rate is high; thus the proportional number of legitimate births annually in the ten years 1861-70, to every 100 married women aged 15-55, in the counties of Durham and Stafford, was 25·3 and 24·8 respectively, while in the counties of Devon, Dorset, and Hereford, the proportions were only 21·2, 21·7, and 19·7 respectively.

If the ratio of *illegitimate births* to spinsters and widows aged 15-55 be compared in these counties, the results are nearly equally striking; the average annual number of illegitimate births to every 100 unmarried women being 2·2 in Durham and 2·4 in Stafford, while in Devon, Dorset, and Hereford, the proportions were 1·3, 1·5, and 2·0 per cent.

Sex.—The births of 421,307 boys and 404,600 girls were registered in 1872, so to every 100·0 girls 104·1 boys were born. The proportions varied in the different counties: in Bedford (97·6 boys to 100 girls), in Huntingdon (98·6), and in Leicester (99·8), fewer boys than girls were born: the counties in which the largest proportional number of boys was born were, Wilts 107·1, Hants 107·7, Westmorland 108·8, and Hertford 111·4.

Taking the mean of the ten years 1862-71, the highest proportions of boys were in Cumberland, Cornwall, North Wales, Northumberland, and Northampton; the lowest in Huntingdon and Hertford. The smallest numbers fluctuate most, in conformity with a mathematical law.

Children born out of wedlock.—The number of children born, in any country, out of wedlock is not exactly known. Of the 825,907 births registered in England and Wales in the year 1872, 44,766, or 5·4 per cent., were recognised as illegitimate. The mean of the ten years 1862-71 was 6·0. The per-centage of registered illegitimate births to total registered births has declined from 6·7 in the five years 1846-50 to 5·7 in the five years 1868-72, while the marriage-rate has increased, the number of

* See Vol. IV. Census of England and Wales, 1871.—General Report, Table 81, p. 68.

persons married to every 100 of the population in the seventeen years 1838-54 being 16·3, while the rate in the eighteen years 1855-72 was 17·6.

In those counties which are notorious for a high rate of illegitimacy little or no improvement is observed in the returns for recent years, but a glance at the results for a series of years reveals a striking decrease in the following counties.

	Average Annual Percentage of Illegitimate Births to Total Births.	
	10 Years 1853-62.	10 Years 1863-72.
Hereford	9·2	8·3
Nottingham	9·0	8·3
Suffolk	8·2	7·3
Leicester	7·9	6·9
Chester	7·9	6·7
Derby	7·5	6·8
Berks	7·3	6·3
Cambridge	7·3	6·7
Wills	7·0	6·2
Sussex	6·8	5·8
Bucks	6·7	6·0
Lancaster	6·6	5·7
Dorset	6·6	5·8
Worcester	6·5	5·8
Somerset	6·2	5·4
Hants	5·8	5·1
Kent (<i>extra-metropolitan</i>)	5·7	4·9
Surrey (<i>extra-metropolitan</i>)	4·8	4·1
Middlesex (<i>extra-metropolitan</i>)	4·6	3·8

The mean number of unmarried women in England and Wales aged 20-40 at the Censuses of 1861 and 1871 was 1,370,178; and the average annual number of children born out of wedlock in the ten years 1861-70 was 45,701, so if the mothers of these children were all of the ages 20-40, then 3·34 in every 100 unmarried women bore children annually; but a certain proportion (about 11·967 per cent.*) belonged to women under 20 and above 40. Deducting this proportion, it would appear that the number of illegitimate children to unmarried women aged 20-40 was 40,232: so 2·94 in every 100 unmarried women bore children annually, or to every 34 spinsters and widows aged 20-40 one child was born annually.

DEATHS.

492,265 deaths were registered in England and Wales in the year 1872, a number less by 22,614 than in the previous year, and less by 23,064 than in 1870. Some of the severe epidemics which so unduly increased the mortality during the last three or four years have subsided, and the year exhibits a comparatively low death-rate, as will be seen by the annexed figures.

Years.	Deaths to 1000 persons living.
1867	21·7
1868	21·9
1869	22·3
1870	22·9
1871	22·6
1872	21·3

The mortality was 1·0 per 1000 below the mean rate of 35 years, and we must refer back as far as the year 1860 to find a death-rate as low as that now recorded.

* See the 14th Annual Report, p. xiii.

An inquiry into the *causes* of the deaths of the year, by Dr. Farr, —showing which of these have prevailed with mitigated severity—will be found in the Appendix to this Report, pp. 219–229.

The year 1872 will be memorable as the commencement of a new era in the promotion of health and the prevention of certain forms of disease, for one great obstacle to sanitary progress has now been removed by the passing of the Public Health Act. The confusion which existed, prior to its passing, as to who was the responsible *local* authority for sanitary purposes is to some extent removed, and a definite authority upon whom devolves the administration of the laws relating to public health is now designated.

The Act requires that England and Wales shall be divided into sanitary districts designated “urban sanitary districts” and “rural sanitary districts.” The urban sanitary districts to consist of (1) boroughs, (2) Improvement Act districts, and (3) Local Government Act districts, constituted such either before or after the passing of this Act; the *urban sanitary authority* being (1) the Mayor, Aldermen, and Burgesses acting by council, (2) the Improvement Commissioners, and (3) the Local Board, respectively. The rural sanitary districts to consist of Poor Law Unions, the *rural sanitary authority* being the Board of Guardians.

The Act also requires that every sanitary authority shall appoint, as medical officer or officers of health, legally qualified medical practitioners, an inspector or inspectors of nuisances, and other necessary officers.

The working of the Act has to be established and its administrative machinery perfected before we can see its beneficial operation reflected in a marked improvement of the public health. Successful efforts have been made to improve the sanitary condition of some of the large towns, but the great work of removing causes which are so prejudicial to life—arising from overcrowding, want of proper ventilation, bad drainage, and impure water supply—still remains unaccomplished or incomplete in the towns and villages scattered throughout the length and breadth of the land. Town populations are increasing without equivalent sanitary arrangements, and although any improvement is commendable, still, when such arrangements are but partially carried out, and when only spasmodic efforts are made for the removal of agencies unfavourable to health, they cannot be expected to go far in diminishing the general mortality.

When, through experience, the administrative functions of the local officers are less imperfect, and the sanitary works of the country are no longer partial, the good effects of improvements will be as visible in the death-rate of England and Wales as they are in the reduced mortality of some of our large towns since they have been well drained and supplied with wholesome water.

Until such progress has been made, as the town populations are rapidly increasing, there will be no striking reduction in the death-rate of the country.

Sex and Age.—Of the 492,265 deaths registered in 1872, 255,135, or 51·8 per cent., were those of males, and 237,130, or 48·2 per cent., were those of females, so the deaths of males were to those of females in the proportion of 108 to 100. More boys than girls are born; but, owing to the emigration of males exceeding that of females, the female exceeds the male *population*. On the supposition that the numbers of each sex living were equal, then the deaths of males to every 100 deaths of females would be 113, but the female population is in excess of the male, and notwithstanding the risks of childbirth the mortality of females is less than that of males, the deaths of males to 1000 males living in 1872 being 22·7, while the deaths of females to 1000 females living was only 20·0. The annual rate of mortality of males is ·6 per 1000 less than the mean of 34 years, and 1·2 per 1000 less than in 1871. In the female rate the reduction is still more striking, the annual rate of mortality

in 1872 being 1·5 per 1000 less than the mean of 34 years, and 1·3 less than in 1871.

There are laws governing the rise and decline of diseases which have yet to be discovered, but the sanitary inquiries which have been carried on in connection with the returns of this office for a period of 35 years have done much to disclose the agents which tend to produce epidemic diseases. In the year 1872 the returns of the causes of death show that diseases of children were for the most part the disorders which assumed anything like an epidemic form; and if it be true that children are always the greatest sufferers from epidemics, and that they suffer in proportion to their low sanitary condition, then the agencies that are prejudicial to childhood merit the deepest study of the sanitary reformer.

Of the 255,135 deaths of males registered in 1872, 105,846, or 41·49 per cent., occurred at ages under 5 years. At ages 5-10 years the proportion was 3·78 per cent., and at 10-15 years it was 2·02 per cent., so that to every 100 deaths of males at all ages nearly one half, or 47·29 per cent., occurred at ages under 15 years. Of the 237,130 deaths of females at all ages, 91,593, or 38·63 per cent., were those of children under 5 years. At ages 5-10 the proportion was 3·80, and at 10-15 it was 2·07; the proportional number under 15 years of age, 44·50, was rather less than that for males.

The rate of mortality per 1000 living in the first five years of life was 67·8 for males, and 58·8 for females; at ages 5-10 years 7·0 and 6·5, and at ages 10-15, 4·2 and 4·0 respectively.

A comparison of the mortality in 1872 with the mean annual rate in the 34 years 1838-71 shows that the reduction in the death-rate is in great part due to a lower rate of mortality among children under 15 years of age, as will be seen by the following results, traceable to the decline of some zymotic diseases. Small-pox, whooping-cough, and diarrhoea, however, were especially fatal to children in the year 1872.

The mortality of females in 1872 was lower than their average at all the periods of life except the last: in men the exception covers the middle period of life; the mortality of men of 25-65 exceeds the average. The mortality at the several ages has to be studied in connection with the causes of death.

Seasons.—Great fluctuations in the temperature generally bring about a high rate of mortality, but the meteorological conditions of the year 1872 were favourable to the public health. In the *first quarter* of the year the mean temperature of the air at Greenwich was 45°·6, or 5°

above the average of 101 years, and the rain-fall measured 6·5 inches, or 1·4 inches above the average: owing partly to the clemency of the season the mortality was low, being at the annual rate of 23·5 per 1000 of population, or 1·4 per 1000 below the average of 35 years. In the *second quarter* the mortality was at the annual rate of 21·0 per 1000, or 1·1 per 1000 below the average: the mean temperature of the season was 52°·8, or 0°·5 above the average, but the weather during the quarter was very changeable; the rain-fall at Greenwich was about the average, viz., 5·7 inches. In the *third quarter* the rain-fall was below the average quantity at Greenwich, but in the country generally as much as 10·1 inches fell; the annual death-rate was equal to 20·5 per 1000 of population against an average rate of 20·7: the weather was warm, the mean temperature being 61°·1, or 1°·5 above the average. In the *last quarter* of the year the extraordinary amount of rain which fell—11·3 inches, or 4·2 inches above the average—and the high temperature of 45°·3, or 1°·7 above the average, apparently exercised a beneficial influence on the public health, the annual rate of mortality being only 20·2 per 1000 of population, or 1·7 per 1000 below the average. Detailed information respecting the meteorology and evidences of the registration returns in the four quarters of 1872 is contained in the "Summary of the Quarterly Reports" given in subsequent pages (xxx–xlvi), and in Mr. Glashier's remarks on pages lvii–lix.

Locality.—In reviewing the mortality in different localities the occupations and density of the population, together with other elements, have to be taken into consideration. The results recorded year by year show that a much larger number of deaths in proportion to population occurs in towns than in rural districts; special causes are at work in the denser districts of England and Wales most injurious to life. In the year under review the deaths were singularly below the average in the districts and sub-districts comprising the chief towns; the average annual death-rate among these, in the 10 years 1862–71, was 25·0 per 1000 of population, whereas in the year 1872 it was only 23·4. Turning to the eleven great *divisions* into which the country is divided, two—the North Midland, and the Northern—are observed where the mortality was high, but with these exceptions the mortality was below the average in the 10 years 1861–70 in every division. In Leicester the rate of mortality was above the average by 1·3 per 1000, in Durham by 1·5, in North Wales by 1·6, and in some other counties there was a slight rise in the death-rate. London was much healthier than usual, and the other divisions in which the greatest reduction in the mortality is observed, as compared with the mean annual rate in the 10 years 1861–70, are the South Eastern, North Western, Eastern, South Midland, and South Western. In *Counties* the reduction is greatest in Hereford, where the fall was 3·4 per 1000, Berks 2·8, Hunts 2·5, Gloucester 2·5, Dorset 2·3, Surrey (extra-metropolitan) 2·3, Middlesex (extra-metropolitan) 2·2, Bedford 2·1, Wilts 2·0, and Sussex, Bucks, Oxford, Essex, and Lancaster, each 1·9.

In the "Summary of the Quarterly Reports" subsequently given (pp. xxx–xlvi) will be found detailed remarks upon the sanitary condition of different localities as indicated by their death-rate in each quarter of 1872, together with such conclusions relative to the marriages and births as seemed to be deducible from the observed facts. And with regard to the large cities and towns, of which a selection of seventeen has been made, with London at their head, I have nothing now to add to the comments in the Annual Summary of the Weekly Returns for 1872, hereto appended (pp. xlix–lvi).

Deaths in Public Institutions.—It appears that of the total deaths registered in England and Wales in 1872, 42,806, or 8·7 per cent., occurred in 1245 principal public institutions. Of these 42,806 deaths,

27,374, or 64 per cent., occurred in 712 workhouses, 11,638, or 27 per cent., in 450 hospitals, and 3794, or 9 per cent., in 83 lunatic asylums. The large increase (104) in the number of hospitals since last year is chiefly owing to the general erection of Cottage Hospitals throughout the country.

As explained in an introductory note (p. 99) the Table of deaths registered in the principal public institutions situate within the several districts and sub-districts (pp. 100–117) will afford the means of correcting the death-rates, and so will be invaluable for purposes of local inquiry. Obviously, there is great disparity in the facilities the populations of different parts of the country have of access to institutions for the relief of their necessities. In London 16·7 per cent. of all the deaths registered in 1872 took place in workhouses, hospitals, or lunatic asylums, in the South Eastern Counties the proportion was 11·7 per cent., in the South Midland 9·2, in the Eastern 8·2, in the South Western 7·0, in the West Midland 7·8, in the North Midland 6·0, in the North Western 8·2, in Yorkshire 5·6, in the Northern Counties 5·1, and in Monmouthshire and Wales 3·9.

PROGRESS OF REGISTRATION.

Names on the Registers, and Searches.—The names of all persons whose marriages, births, and deaths, have been recorded in the registers during the last 35½ years are, for the convenience of public reference, inscribed in alphabetical Indexes deposited at the Central Office.

From the middle of the year 1837 to the end of the year 1865 the Indexes are in *manuscript* and extend over 1,741 volumes. For the years 1866–72, the Indexes are *printed*, and are consequently less voluminous; they comprise only 84 volumes. The 48,759,698 names—of which 1,720,706 were entered in 1872—are, therefore, contained in 1825 volumes. The Index for the year 1872 consists of 12 volumes.

That the public are alive to the increasing utility of the registration of marriages, births, and deaths, may be inferred from the fact that the annual number of searches in the five years 1843–7—exclusive of searches in non-parochial registers, and of searches for purposes connected with the Factory Acts—averaged only 778, whereas in the five years 1868–72, the average annual number was 15,057 at the Central Office. The amount of fees received and paid into Her Majesty's Exchequer for searches and certificates in the year 1872 was 2,867*l.* 5*s.* 6*d.*

For a complete list of all the public registers and records in my custody I refer to my 34th Annual Report (pp. xxi–ii).

UNITED KINGDOM.

The enumerated population of the United Kingdom, excluding the islands in the British seas and Army, &c. abroad, at the Census of 1871 was 31,484,661,* and it is estimated that by the middle of the year 1872 the population had increased to 31,839,260, of which 23,067,835 belonged to England and Wales, 3,399,226 to Scotland, and 5,372,199 to Ireland.

The estimated increase of population in England and Wales, from the middle of 1871 to the middle of 1872 was 285,023, and that of Scotland 31,304, but in Ireland the population continued to be reduced by emigration and the estimated decrease of population in this part of the United Kingdom in the twelve months ending 30th June 1872 was 22,808.

In the year 1872, 78,102 *Irish* emigrants left the Irish ports, being an increase of 6862 over the number in 1871. The diminution in the population of Ireland since 1851 has been caused by emigration alone, no fatal epidemic having prevailed during that period, and the official returns

* This will be found to differ slightly from the population returned in the 34th Annual Report p. xxiii. owing to the numbers for Ireland, at the date of publication, not being finally revised.

show that no less than 2,162,596 emigrants left Ireland during the period from 1st May 1851—the date when the collection of the returns first began to be made at the several Irish Ports—to 31st December 1872. These numbers include not only emigrants as hitherto understood, but all the Irish who leave their ports to go to England, Scotland, and the Channel Islands.

The registration of marriages, births, and deaths in Ireland continues defective; and the Registrar General of Ireland* regrets that there is but little improvement in recent years. Notwithstanding the institution of several prosecutions which have been attended with some advantages, he still has to report numerous cases of neglect to register births and deaths. The registration of marriages is also unsatisfactory owing to the clergy in some districts declining to sign the necessary certificates.

The marriage-rate in England in 1872, 17·5 per 1000 of population, is higher than that of Scotland 15·1; the English birth-rate is also higher, 35·8, whereas in Scotland it was 35·0. The respective death-rates were 21·3, and 22·3, the mortality of Scotland exceeding that of England by 1 per 1000.

THE ARMY.

The returns relating to the British Army for the year 1872—with which I have been favoured by His Royal Highness the Field Marshal Commanding-in-Chief, show that the mortality of the Army at home was below the average, while the mortality of the portion of the Army serving abroad was above the average. The average strength of the Army at home and abroad in 1872 was 192,007, and the number of deaths was 2649, the rate of mortality being 13·8 per 1000, against 12·1 in 1871.

At home, the average strength was 104,154, the deaths were 940, and the rate of mortality per 1000 of mean strength was 9·1 among officers, and 9·0 among non-commissioned officers and men, against an annual average of 10·5 and 11·2, respectively, in the six years 1866–71.

Abroad, the average strength in 1872 was 87,853, the deaths were 1709, and the rate of mortality per 1000 of mean strength was 14·2 among officers, and 19·7 among non-commissioned officers and men, against an annual average of 12·6 and 18·3, respectively, in the six years 1866–71.

THE NAVY.

The official returns for the year 1872 show that the total force afloat was 46,830, and the deaths 385, so the rate of mortality was 8·2 per 1000. Compared with the previous year this represents a reduction of ·3 per 1000.

The number of deaths from disease was 266, and from wounds, injuries, and drowning 119. The mortality from disease was 5·7 per 1000, and from wounds, &c., 2·5 per 1000, against 6·3 and 2·1, respectively, in 1871.

Out of the 266 deaths from disease, 11 are referred to small-pox, 23 to enteric fever, 53 to consumption, 25 to heart disease, and 31 to pneumonia. In every 100 deaths 30·9, or nearly one-third were from wounds, injuries, or drowning.

The lowest ratio of sickness in 1872 was on the South-east Coast of America; the highest on the Mediterranean Station. Only 4 unimportant cases of scurvy occurred, a rare disease so far as the royal navy is concerned.

The mean force employed in 1872 on the *Home* Station was 23,000, and the deaths were 144, being in the proportion of 6·2 per 1000, and representing a reduction of ·4 per 1000 compared with 1871.

* See the 7th Annual Report of the Registrar General of Ireland recently published, relating to the Abstracts for the year 1870, pp. 14–15.

The annexed Table shows the mortality at the different Stations during the year 1872 :—

STATIONS.	DEATHS per 1,000 Forces.			
	In the Year 1872.			Annually in 16 Years.
	From Disease.	From Wounds, Injuries, and Drowning.	Total from All Causes.	Total from All Causes.
Home	4·9	1·3	6·2	8·1*
Mediterranean	5·8	1·6	7·4	9·9
North America and West Indies	6·4	3·1	9·5	17·7
South-east Coast of America	7·5	1·5	9·0	16·1†
Pacific	4·0	4·5	8·5	9·3
West Coast of Africa & Cape of Good Hope	13·7	2·2	15·9	24·4
East Indies	8·6	4·0	12·6	15·3
China	2·9	2·6	5·5	35·5
Australia	6·3	1·8	8·1	11·7
Irregular	6·7	5·6	12·3	10·1
Total	5·7	2·5	8·2	—

* Including the deaths by the loss of Her Majesty's ship Captain the rate was 9·5.

† Including the deaths by the loss of Her Majesty's ship Bombay the rate was 21·2.

The following Table shows the number of men and boys in the Royal Navy, and the number of deaths from disease and injury in the five years 1861-5, at different periods of age :—

AGES.	Number of Men and Boys enumerated five times in the 5 Years 1861-65.	Number of Deaths in the 5 Years 1861-65.			Deaths per 1000 Strength annually in the 5 Years 1861-65.		
		Disease.	Injury, including Drowning.	Disease and Injury.	Disease.	Injury, including Drowning.	Disease and Injury.
All Ages	223,135	1,890	971	2,861	8·2	4·4	12·6
15-25	124,361	890	543	1,433	7·1	4·4	11·5
25-35	69,701	555	308	863	8·0	4·4	12·4
35-45	21,050	261	96	357	12·4	4·6	17·0
45-55	5,982	100	17	117	16·7	2·8	19·5
55-65	2,032	24	7	31	11·8	3·4	15·2

From this Table it will be seen that the average annual rate of mortality from disease in the Navy, in the five years 1861-5, increased from 7·1 per 1000 strength at ages 15 and under 25, and 8·0 at ages 25-35, to 12·4 at ages 35-45, and 16·7 per thousand at ages 45-55. The proportional number of deaths from violence is nearly the same at the periods of age 15-25, 25-35, and 35-45.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—By the Act 6 & 7 Will. IV. cap. 86, sections XXI. and XXVI., and by the Merchant Shipping, and Passengers' Acts, it is required that captains or commanding officers of British vessels shall send to me a copy of the particulars touching births and deaths that occur at sea among English subjects, but the particulars of only 73 of such births and 219 of such deaths were reported to me in 1872 and entered in the Marine Register Book at this office, whereas the number of births

and deaths of British subjects at sea reported to the Registrar General of Shipping and Seamen during the year was 289 and 547 respectively.

Mercantile Marine.—The Registrar General of Shipping and Seamen reports the number of mariners at sea, exclusive of masters, in the year 1872 to be 203,720. Out of this number 4123 deaths occurred, and though still excessively high, the mortality, 20·2, was below the average of the previous 20 years, 21·1.

The number of mariners in the Merchant Service, exclusive of masters, whose deaths are referred to drowning by accident and by wreck in 1872 was 2207 out of a total force of 203,720: the number of deaths in the Royal Navy from drowning in the same year was 67, out of a force of 46,830, so the respective rates of mortality from this cause of death were 11·3 per 1000 in the Mercantile Marine, and only 1·4 per 1000 in the Royal Navy. There can be no doubt that the dangers of the sea are greatly aggravated by the neglect of required precautions.

WILLS.

Printed Calendars of all grants of probates and administrations from the year 1858 to the present time, showing the names and descriptions of the testators and intestates alphabetically arranged, together with other particulars, are deposited for public reference at this office.

Mr. Leslie in his annual report of Judicial Statistics for 1872 publishes a return from the Chief Registrar of the Court of Probate, which shows that the number of probates and administrations granted at the Principal Registry during the year was 15,455. The value of the effects was sworn under 63,421,915*l*.

The returns furnished by the district Registrars record the number of probates and letters of administration granted in the 40 district registries during the year as 24,850. The value of the property under which these probates and administrations were sworn was 52,012,993*l*.

The results for the Principal and District Registries combined were—probates and administrations 40,305—value of effects sworn under 115,434,908*l*. The average value for each being 2864*l*. against 2826*l*. in the previous year. The proportion of the cases in which people above the age of 21 left wills, or left estates on which letters of administration were taken was 1 in 6·2, or 16·2 per cent.

SUB-DISTRICTS OF ENGLAND AND WALES.

The registration of births and of deaths is performed either at the houses of the people or at the offices of the 2,195 registrars. As each informant has to go to the office of the registrar of his sub-district, or the registrar has to go to the house in which the event occurred, it is evident that the size of the sub-district is one important element in the administration of the Act. A second element is the population, for the births and deaths bear a certain though variable relation to the existing numbers. A third element is also important, and that is the mode in which the population is distributed over the area as the population may be dispersed pretty evenly in farms and cottages over a wide area of country, or a dense ward of a city; again it may be, and is often concentrated chiefly in a town, but with wide suburbs, and with open country parishes associated with the town for registration purposes. The original church registration of baptisms and burials, as well as marriages, was parochial; it was performed at the church; so the informants had to go to the registering clergyman, but had not to travel further than the limits of the parish which, however, might be great or small. That system of registration was, as it is well known, incomplete, as regards both births and deaths.

The sub-district was substituted for the parish as the registration administrative area; and containing a variable but an average number of

7 parishes, it increased the distances to be travelled; with this alleviation to the public, but aggravation to the labor of the registrar, that the registration of birth or death might be performed in the house where the event occurred.

There were countervailing advantages: where the registrars were paid by a fee for each event registered, an extensive population might supply them with sufficient employment, and such an income as would command the services of educated men.

The division of the country into sub-districts in the first instance was made by the Poor Law Commissioners and Guardians, apparently without any very definite rule as to size or population; but the general result is, that there are seven parishes on an average to each; that the average area of a sub-district is $26\frac{1}{2}$ square miles, the average population in 1871 *ten thousand three hundred and forty-seven*: while the average number of persons married in a sub-district in that year was 173, of births 363, of deaths 235. Then the weekly number in an average sub-district was 7 births, and 4 or 5 deaths; making about 11 births or deaths weekly. If the registrars visit every house to register births and deaths, they cannot on an average travel more than *two* miles in each case, nor probably much less than one mile unless they arrange to register the births periodically in beats. Their pay is at the rate of a shilling an entry, and 1s. 6d. additional for the first 20 births or deaths.

While the average area and population are as given above, the extremes are very wide from the average. The sub-district of Berwick-street, St. James's, London, comprises only 24 acres (0.0375 mile), while Bellingham in Northumberland, round the tributaries of the North Tyne comprises 175,131 acres (274 square miles).

The annexed Table (A.) shows that 11 sub-districts have less than 1000 inhabitants; and 11 have populations ranging from 71,319 to 123,915. The table shows a striking contrast.

TABLE (A.)—The 11 least and the 11 most Populous Sub-districts (1871).

DIVISION.	DISTRICT.	SUB-DISTRICT.	POPULATION.	AREA IN ACRES.

X.	Bellingham	Bellingham	176,131	3,790

Note.—A square mile consists of 640 acres.

As it is evident that both area and population have to be taken into account in forming districts of suitable size, I have shown in the sub-joined Table (C.) the populations of sub-districts of every degree of magnitude.

TABLE (C.)—The Sub-districts of England and Wales, showing their Area and Population.

[The Mean Area of a Sub-district is 26'566 square miles (=17,003 acres), and the Mean Population is 10,347.]

Mean Distance of Population from Centres* in Miles.	AREA.		Total Sub-districts.	POPULATION.																
	Square Miles.	Acres.		Total Sub-districts.	POPULATION.															
					Under 500.	500—	1000—	2000—	3000—	4000—	5000—	10,000—	20,000—	30,000—	40,000—	50,000—	60,000—	70,000—	80,000—	90,000—

3'26	4'39	7'0-	44,800-	39	-	1	4	3	4	30	8	-	-	-	-	-	-	-	-	-
3'47	5'30	8'0-	51,200-	34	-	-	-	1	-	8	12	3	-	-	-	-	-	-	-	-
3'67	5'30	9'0-	57,600-	18	-	-	-	1	1	14	2	-	-	-	-	-	-	-	-	-
4'21	6'21	100 & up to 374.	64,000 & up to 176,131.	22	-	1	-	5	1	13	2	-	-	-	-	-	-	-	-	-

NOTE.—The Table may be read horizontally thus:—Of 475 Sub-districts having an area of 20 and under 30 square miles (=12,800 or less than 19,200 acres), 1 has a Population of under 500; 1 a Population of 500 and under 1,000; 26 a Population of 1000 and under 2000; 63 a Population of 2000 and under 3000, and so on. Or the Table may be read vertically thus:—Of 800 Sub-districts having a Population of 6000 and under 10,000, 23 have an Area of less than a square mile; 31 have an Area of 1 square mile and less than 5 square miles; 50 an Area of 5 and less than 10 square miles; and so on.
* This is the distance if the Population were equally distributed over the area: it is therefore the maximum distance. As the Population is clustered round one or more centres the actual distance is less.

Thus it will be noted that 475 of the sub-districts had an area of 20 and under 30 square miles, equivalent in area to circles with radii ranging from 2·82 to 3·34 miles; that 2 of them had a population under 1000; 244 a population under 5000; 166 a population of 5-10; 54 a population of 10-20 thousand; and 11 a population of 20-30,000.

When a country has once been sub-divided for any administrative purpose in which officers are appointed to distinct portions of territory, any change is attended with some inconvenience, and some disturbance of vested interests. But there can be no doubt that with the experience that has been acquired, a better working division of the country could be made now; so as to retain or secure the services of able registrars, and at the same time to offer the public greater facilities. Thus the sub-districts of 80 square miles of territory, equal to a superficies of 8 by 10 miles are too large; and this is still more the case with sub-districts of 90, 100, and so on up to 274 square miles.

Upon the other hand as regards area, the sub-districts of less than a square mile are below the mark; though many of these very small sub-districts are populous, and five have a population exceeding 50,000.

The large sub-districts of Croydon with 71,319 inhabitants, of Preston with 85,427 inhabitants, including something more than the towns, are conveniently served by one registrar; and the same may be said of the other 9 most populous sub-districts, one of which (Everton in West Derby, near Liverpool) contained in 1871 *one hundred and twenty-three thousand nine hundred and fifteen* inhabitants.

The advantages in towns attainable in ample sub-districts are various; good officers, with due care in the selection can be obtained, as the remuneration is sufficient to pay for the whole of their time, and a place for the registry office can be found in some well known central public building. In the continental cities it is in the Town Hall. As a general rule the largest sub-districts are among those in which the registration is by far the most efficiently performed.

FOREIGN STATES.

Through the courtesy of M. V. Falbe-Hansen, Dr. Berg, and M. Von Baumhauer, I am enabled to publish, for the first time, returns of the vital statistics of Denmark, Sweden, and the Netherlands. These interesting returns together with the usual results for other Foreign States will be found in a series of Tables on pp. cxvii-cxxii.

The States are arranged in the order determined by a resolution of the Statistical Congress held at St. Petesburgh in 1873.

The first division represents the North-east of Europe and comprises England, Denmark, Norway, and Sweden; returns from Norway are wanting to complete this division. The Eastern division follows next in order, and is represented by Russia, from which State I hope soon to receive returns. Then follows the Central division comprising Austria (including Hungary), Switzerland, the German Empire, the Netherlands, Luxemburg, Belgium, and France; for this division I have only received returns from Austria, Prussia, the Netherlands, and France. Next in order is the Southern division, comprising Portugal, Spain, Italy, Greece, Turkey, Montenegro, Servia, and Roumania; for this division returns have been received from Spain and Italy. From the United States of America no aggregate returns have been received owing to the regrettable absence of any system of registration under Federal control.

The following Table shows the average annual rates, per 1000 of population, of persons married, births, and deaths in the various States from which returns have been received:—

AVERAGE ANNUAL RATES, PER 1000 POPULATION, IN THE 20 YEARS 1853-72.									
COUNTRIES.	ENGLAND AND WALES.	DENMARK.	SWEDEN.	AUSTRIA.	PRUSSIA.	THE NETHERLANDS.	FRANCE.	SPAIN.*	ITALY.*
PERSONS MARRIED	16·7	15·9	14·1	17·3	17·1	15·9	15·9	15·1	15·4
BIRTHS - - -	34·8	31·6	29·0	40·2	39·3	34·3	36·1	37·2	37·3
DEATHS - - -	23·4	20·3	20·4	31·9	28·3	26·7	24·4	29·7	30·1

* The mean annual rates for Spain are for the ten years 1861-70, those for Italy are for the nine years 1863-71.
NOTE.—See explanatory note at foot of Table 64 accounting for any remarkable increase in the respective rates.

The marriage-rate, as will be seen in the above Table, is highest in Austria 17·3, Prussia 17·1, and England 16·7. It is lowest in Sweden, 14·1; Spain, 15·1; and Italy, 15·4; and the rate is uniformly in Denmark, the Netherlands, and France, 15·9.

The birth-rate is highest in Austria, 40·2; in Prussia it is 39·3, Italy 37·3, and Spain 37·2. In England, with a defective birth registration, it is 34·8, in the Netherlands 34·3, Sweden 32·0, Denmark 31·6, France 26·1.

The recent Census of France in 1872, after the termination of the war, shows a large decrease of population since the previous enumeration in 1866. The diminution is thus accounted for in the French Census Report:—*

Enumerated Population in 1866	-	-	38,192,064
Ditto ditto in 1872	-	-	36,102,921

2,089,143

Deduct for loss of territories of Alsace-Lorraine

1,597,238

Decrease of Population in the six years 1866-72 491,905

This decrease of population amounting to 491,905 or 1·29 per cent. is mainly attributable to loss of life in the war against Germany, but the report also mentions two other causes, the epidemic of small-pox, which raged in 1870-1, and a decrease in the same years in the number of marriages, and consequently in the number of births. The total loss of population including the territories ceded to Germany is equivalent to 5·47 per cent. If the French increased as rapidly as the English these numbers would be replaced in less than ten years.

It will be seen from the following statement of the numbers, and proportions to population of persons married, of births, and deaths, in France in each of the seven years 1866-72, that after the termination of the war the marriage and birth-rates rose considerably, and the mortality was lower than it had been for some years previous to 1870-1.

FRANCE.

* Statistique de la France, Résultats Généraux du Dénombrement de 1872, pp. xv-xvi.

The death-rates per 1000 of population show that the mortality is highest in Austria 31·9, Italy 30·1, Spain 29·7, and Prussia 28·8. It is lowest in Denmark 20·3, Sweden 20·4, England 22·4, France 24·4, and the Netherlands 25·7.

The mortality in the various States is unduly raised in certain years by pestilence and by war. Thus in 1853 Denmark suffered from cholera and the mortality was raised to 24·3 per 1000, the average being 20·3. Sweden also suffered from the same scourge in 1853, 1857, and 1866, when the respective death-rates were 23·7, 27·6, and 20·0, against an average rate of 20·4. In 1866, Austria and Prussia suffered severely from cholera and their respective death-rates were 33·3 and 35·7, against averages of 31·9 and 28·8. Cholera was epidemic in the Netherlands in 1859 and 1866, and small-pox in 1871; the mortality was 31·2, 28·7 and 29·4 respectively, whereas the average rate was 25·7. France suffered from small-pox in 1865-6 and the rate of mortality in those years was 24·3 and 23·3, the average rate being 24·4; small-pox broke out again in France, as has been mentioned above, in the years 1870-1.

Deaths in war also contributed to raise the mortality in Austria in 1866 to 33·3, in Prussia in 1866, 1870, and 1871, to 35·7, 27·6, and 29·8, respectively, and in France in 1870-1 to 28·3 and 34·8.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

Summary of the Quarterly Reports, 1872.

First Quarter.—January, February, March.

In the UNITED KINGDOM the births of 279,478 children, and the deaths of 185,611 persons of both sexes, were registered in the three months ending 31st March 1872. The natural increase of population was thus 93,867.

The registered number of persons married in the quarter ending March 31st, 1872, was 113,308.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The improvement in the prospects of the marriageable population is shown in the increase of weddings in the first quarter of the year, which exceeded the average, and were considerably in excess of the numbers returned in any winter quarter since 1866. The birth-rate was slightly under the average; the death-rate was low both in town and country. The frosts of the last months of 1871 had proved fatal to many old people, who, like the leaves of autumn, are easily shed; and the survivors enjoyed the mild and exceptional winter that followed, so several thousands of them are alive who must have succumbed had the winter been severe. Small-pox became epidemic at the end of 1870 and raged through the following year; it grew excessively fatal in the spring of 1871 and then declined; but in the past winter it was more fatal than before, and 7720 children and others died of the disease. Scarlet fever and fever were less prevalent than they had been; measles and especially whooping-cough became more active and fatal.

Marriages.—The number of persons married in the first quarter of the year 1872 was 81,078, or 8468 more than in the corresponding quarter of 1871. The marriage-rate which reached its lowest point, 12·9 per 1000, in the March quarter of last year, rose this quarter to 14·1, a higher rate than has prevailed in any corresponding quarter since 1866, and ·3 above the average rate for the winter quarter in the ten preceding years. A comparison of the number of marriages in each county with the average for the three previous corresponding quarters gives the following results worthy of notice. The greatest increase, in proportion to population, is observed in Monmouthshire, Durham, Northumberland, Northamptonshire, and Warwickshire, and may fairly be attributed to the prosperous condition of the population in those counties employed in coal mines and iron works. Lancashire, Leicestershire, Staffordshire, and the West Riding of Yorkshire show a somewhat smaller but still a considerable increase: while Hertfordshire, Huntingdonshire, Norfolk, Wiltshire, Dorsetshire, Herefordshire, and Lincolnshire, the inhabitants of which are for the most part engaged in agricultural pursuits, so far from sharing in the improvement in the marriage-rate, exhibit a positive decrease in the number of marriages registered.

Births.—In the first quarter of 1872, the births of 208,752 children born alive were registered, showing an annual rate of 36·3 per 1000, which is ·8 below the average rate for this quarter of the year. Of the counties, Westmorland, Somersetshire, and Nottinghamshire showed, in proportion to their respective populations, the greatest increase upon the average of the three previous corresponding quarters, and Norfolk, Oxfordshire, and Northamptonshire the greatest proportional decrease.

Increase of Population.—The natural increase of the population, or the excess of births over deaths, amounted during the quarter to 73,800, or 811 per day. The actual increase is affected largely by emigration.

The number of emigrants of British origin who sailed from ports in the United Kingdom at which Government emigration officers are stationed, was 25,660; of whom 15,060 were of English, 1942 of Scotch and 8658 of Irish origin. The total number shows a slight excess over the emigration recorded in the corresponding quarter of last year, the increase being for the most part amongst the emigrants of English origin. Of the above 25,660 persons, 22,931 were bound for the United States, 402 for British North America, and only 1103 for the Australian Colonies, against 2134 in the March quarter of 1871.

Prices, Pauperism, and the Weather.—The price of wheat showed a further slight decline last quarter, the average quotation being 55s. 4d. per quarter against 56s. 3d. in the previous three months.

The average price of potatoes per ton at the waterside market, Southwark, which in the four quarters of the year 1871 was respectively 87s. 6d., 63s. 6d., 68s. 6d., and 89s. 6d., rose to 100s. in the quarter ending 31st March last.

The price of beef and mutton by the carcase at the Metropolitan meat market averaged 6½d. and 7½d. per lb. respectively. In the year 1852 the average price per lb. of beef was 4½d. and of mutton 4½d. In the year 1854 beef had risen to 5½d., and from that time until 1868 the average price for each year ranged from 5½d. to 5¾d. In the three years 1869, 1870, and 1871 it was 6½d., 6d., and 6½d. respectively. Mutton rose in 1853 to an average price of 5½d. per lb., and ranged between 5½d. and 6½d. in the following years until 1865, when it reached 7d. In the five succeeding years it ranged from 6d. to 6¾d., except in 1868 when it fell to 5½d. In 1871 it was again 7d., and in the first quarter of 1872, as above stated, 7½d. The increase in price between 1852 and 1872 in the price of beef was 48 per cent. and in the price of mutton 46 per cent.

Upon classifying them according to years in quinquennial periods, there is seen a progressive rise in the prices of both mutton and beef. Beef was never dearer in the London market than it is now; and taking the average of the first five years 1852–56 and the last 1867–71, the rise was 17 per cent.; in the same periods the price of mutton rose 11 per cent. Upon comparing the first with the last ten years, the prices of both meats rose about 9 per cent.; but the prices of wheat and potatoes declined. The price of beef may have been affected by the cattle plague, and the measures of restriction to which it led. Prices too during the whole period have no doubt been enhanced by the depreciation in the value of money circulating in the world. The exorbitant price of butcher's meat might be reduced to some extent by diminishing the consumption, which in many families is excessive; as it is well known that bread, fruit, potatoes, vegetables, and similar diet furnish adequate sustenance to all adults, except to the men employed in severe physical labour, and, among them, agricultural labourers in many counties get little animal food. Greater simplicity in public dinners, where so much food is wasted, might lead to private economy.

Pauperism declined to a considerable extent last quarter. The average number of paupers relieved on the last day of each week was: In-door 149,604; Out-door 777,575. As compared with the winter quarter of 1871, the decrease in the number of paupers receiving in-door relief amounted to 11,364, and in the number of those receiving out-door relief to 101,999. The average numbers for the past quarter were less than in any previous corresponding quarter since 1866.

The warm weather which set in on 13th December 1871, following a period of unprecedented cold, continued with few and slight exceptions till the 18th of March; the mean temperature of these 97 days was more

than 5° above their average; then followed 8 days of severely cold weather, in the temperature of which the average daily deficiency was $7\frac{1}{2}^{\circ}$; the remaining five days of the quarter were warm. At the corresponding season in the last 100 years the warmth of the past three months has been but once equalled, viz., in the year 1846, and has never been exceeded. The mean temperature for the quarter was $43^{\circ}\cdot6$ or 5° above the average of 101 years.

The rain-fall during the past quarter amounted to 6·5 inches or 1·4 above the average. In February it was only half the average fall, but in both January and March it was in excess.

State of the Public Health; Deaths.—In the first or winter quarter of 1872, ending 31st March, 134,952 deaths were registered in England and Wales; after making due allowance for increase of population, this number was considerably below the average number in the corresponding quarter of recent years, notwithstanding the epidemic of small-pox which showed a somewhat increased and more general fatality.

The annual death-rate was equal to 23·5 per 1000 of the estimated population, against 25·2, the average rate in the first quarters of the ten years 1862–71; the rate in the first quarters of those years ranged from 21·9 in 1868 to 27·5 in 1864. Temperature exercises a more direct influence upon mortality in the first quarter than in other parts of the year. A severe winter invariably produces a high death-rate. The effect of temperature, however, is partially disturbed by the varying fatality of epidemic diseases. In the ten years, 1862–71, the temperature of the three coldest first quarters averaged $37^{\circ}\cdot5$ Fahrenheit, and the annual death-rate 26·8 per 1000; while in the three warmest first quarters the mean temperature was $41^{\circ}\cdot8$, and the average death-rate did not exceed 23·8 per 1000. The mean temperature last quarter averaged so much as $43^{\circ}\cdot6$, and but for the somewhat counteracting influence of the small-pox epidemic the death-rate would have been unusually low.

In the Eleven Registration Divisions of England and Wales the annual death-rate ranged from 19·2 and 20·8 in the South-eastern and South Midland to 26·6 and 27·3 in the North-western and Northern Divisions. The deaths registered in each of the Divisions were below the average number in the three previous corresponding quarters, except in Yorkshire and the Northern and Welsh counties; the excess in these three divisions was principally due to the small-pox epidemic.

In the principal town districts of the country, comprising all the large towns, and a population of about 13 millions, the annual death-rate last quarter was equal to 25·4 per 1000. The remaining or rural population is about 10 millions, among whom the death-rate did not exceed 20·9 per 1000. The urban rate was 2·0, and the rural rate 1·7, per 1000 below their average rates in the corresponding quarter of the ten years 1862–71. If from the entire urban population be excluded 68 of the largest towns, for which special information is given in Tables VI–IX, it will be found that the death-rate in the smaller towns last quarter was equal to 25 per 1000. Allowance being made for the excessive mortality from small-pox in town districts, it will be seen that the remarkably mild weather which prevailed during the first three months of this year more favourably affected the town than the country death-rates. This result further confirms a fact which has previously been proved from these returns, namely, that it is town populations which suffer most from the rigors of a severe winter.

The 134,952 deaths from all causes, at all ages, in England and Wales during last quarter included 31,123, or 23·1 per cent., of infants under one year of age, and 32,452, or 24·0 per cent., of persons aged 60 years and upwards. The infant mortality showed a slight increase upon that prevailing in the first quarter both of 1870 and 1871, which was 22·6 per cent., while measured by the proportion of deaths under one year to

births registered it was 14·9 per cent. last quarter, against 15·8 and 14·9 in the two previous corresponding quarters. The mild weather exercised a direct influence upon the proportion of the deaths of elderly persons, which, as above stated, did not exceed 24·0 per cent., while in the first quarters of 1870 and 1871 it had been 26·3 and 25·6 per cent. respectively.

To the seven principal diseases of the zymotic class 24,794 deaths were referred in England and Wales during the first three months of this year against 26,997 in the last quarter of 1871; these deaths were equal to an annual death-rate of 4·3 per 1000 of the estimated population, while in the first quarters of 1870 and 1871 the rate from these seven diseases did not exceed 3·6 and 3·8 per 1000 respectively.

The 24,794 deaths from these diseases included 7720 from small-pox, 3121 from measles, 3385 from scarlet fever, 586 from diphtheria, 4699 from whooping-cough, 3544 from different forms of fever, and 1739 from diarrhœa. The fatal cases of small-pox were considerably more numerous than in any quarter since the present epidemic broke out in the latter part of 1870. The deaths from measles were 642 less than the number in the last quarter of 1871, but considerably exceeded the average in the seven previous quarters. The fatality from scarlet fever was lower than in any recent quarter, the deaths from this disease having showed a steady decline from 11,746 in the last quarter of 1870 to 3385 in the first three months of this year. The deaths from diphtheria have varied but slightly in the past nine quarters. Whooping-cough is usually most fatal in the winter quarter of the year, but it was exceptionally fatal in the three months ending March last, causing 4699 deaths against 4451 and 2632 in the corresponding period of 1870 and 1871. The 3544 deaths referred to fever, principally of the enteric or typhoid type, declined from the numbers in the corresponding quarters of 1870 and 1871, which were 4177 and 4073 respectively. The deaths from diarrhœa are never numerous in the first three months of the year.

The continued fatal prevalence of the small-pox epidemic calls for more detailed notice. The deaths from this disease in the first three quarters of 1870 averaged only 450, but in the last quarter rose to 1229; in the four quarters of 1871 they were successively 4903, 7012, 4612, and 6380; last quarter they further rose to 7720, which considerably exceeded the number in any quarter of the past 32 years, and were equal to an annual death-rate of 1·3 per 1000 persons living. Of these 7720 deaths last quarter 1179 were recorded in the three Ridings of Yorkshire, 1075 in the Northern, 900 in the Welsh, 862 in the West Midland, and 831 in the Metropolitan Registration Divisions. The epidemic first became fatally prevalent in London and in the large Lancashire towns; here the numbers of deaths have shown a steady decline in recent quarters. The next most important outbreak occurred in the Northern counties, especially in Northumberland and Durham, and apparently reached its climax in the latter part of last year, as the fatal cases last quarter had considerably declined, although again exceedingly numerous in many town districts of those counties. The deaths from small-pox showed a marked and general increase in each of the eight other Registration Divisions, especially in South Wales. It will be useful briefly to note a few of the places in the different divisions in which the epidemic was most fatal, or in which new outbreaks occurred during last quarter. In the South-eastern counties, 67 deaths from this disease occurred in Dover, and 43 in Portsmouth, while they had declined in Alverstoke. In the South Midland counties the most notable outbreak occurred at Northampton, resulting in 157 deaths against 47 in the preceding three months; Bishop Stortford, St. Albans, Bedford, Biggleswade, Cambridge, and Wisbech also suffered from the disease. The 611 deaths in the Eastern counties included 53 in West Ham, 91 in Yarmouth and Mutford, 273 in Norwich, and 18 in Thetford; the fatality

in Norwich showed a considerable decline in the latter part of the quarter. In the South-western counties Plymouth and the surrounding Districts formed the principal centre of infection in which 233 fatal cases were reported; the epidemic also prevailed in Bridport, Bideford, Redruth, Bridgwater, and Yeovil. Of the 862 deaths in the West Midland counties, 263 were returned in Wolverhampton, which was the first important centre of infection in the Division; these showed a slight decline from the number in the preceding three months, and the violence of the epidemic had considerably abated during March and the early weeks of April; the other towns of this Division in which the disease most severely prevailed were Walsall, Dudley, Stourbridge, Coventry, Wellington (Salop), and to a less extent Bristol and Birmingham. Nottingham was the principal centre of infection in the North Midland counties, in which town 170 of the 588 deaths from small-pox occurred, showing a considerable increase upon the previous quarter; the epidemic also became fatally prevalent last quarter in the neighbouring Districts of Radford, Basford, Mansfield, and Worksop; and also prevailed in Chesterfield, Belper, and Ashby-de-la-Zouch; towards the end of the quarter, and during April, the disease became epidemic in Leicester. In the North-western counties the deaths from small-pox showed a general decline last quarter, which was most conspicuous in Liverpool, Birkenhead and Manchester. In the Yorkshire Division the deaths from small-pox, which had been 69, 98, 129, and 708 in the four quarters of 1871, further rose to 1179 in the first three months of this year; of these, 895 occurred in the West Riding, including 430 and 88 in the boroughs of Sheffield and Leeds, and 63 in Doncaster, 60 in Wakefield, and 48 in Pontefract Districts; of the 169 deaths in the East Riding, 118 occurred in the borough of Hull, and 20 in York district; the 115 in the North Riding included 38 in Scarborough, 36 in Malton, and 18 in Guisbrough Districts, respectively. In the Northern Division the fatal cases which had been 1566 and 1546 in the two preceding quarters declined to 1075 in the three months ending 31st March last, of which 781 occurred in the county of Durham, 262 in Northumberland, 32 in Cumberland, while Westmorland was the only one of the English counties in which no death from small-pox occurred; in Durham county the epidemic, although still fatally prevalent in the mining districts, showed a general decline, especially in Sunderland, South Shields, and Gateshead, but in Auckland District the fatal cases rose from 105 in the last three months of 1871, to 199 last quarter; in Northumberland the decline was general, but most marked in Newcastle and Tynemouth; the deaths from this cause in Cumberland were principally confined to Cockermouth and Wigton, and showed a decline upon those in the preceding three months. In the Welsh Registration Division, including the county of Monmouth, the fatal small-pox cases, which had been 141 and 539 in the two preceding quarters, rose to 900 in the first three months of this year; of these, 334 occurred in Monmouthshire and 420 in Glamorganshire, so that the number in the rest of South and North Wales did not exceed 146; Bedwelty and Newport Districts in Monmouthshire, and Merthyr Tydfil, Neath, and Pontypridd in Glamorganshire, suffered most severely from the epidemic; in other parts of Wales the disease was prevalent in Crickhowell, Holywell, St. Asaph, and Carmarthen.

The annual death-rate from small-pox in England and Wales during the first three months of this year was, as before stated, equal to 1.3 per 1000 of the estimated population, against 1.1 in the last quarter of 1871. In the 18 largest English towns, the 2585 fatal cases were equal to an average annual rate of 1.6 per 1000; while in 50 other large towns 1296 deaths from small-pox occurred, or equal to 2.1 per 1000. In England and Wales, exclusive of these 68 large towns, which are now estimated to contain a population of about 9,000,000 persons, the deaths from small-pox last quarter were therefore 3839, or equal to an annual rate of nearly

1 per 1000 of a population of rather more than 14 millions. The following are a few of the highest death-rates from small-pox per 1000 persons living during last quarter :—among the 18 largest cities and boroughs, 13·5 in Norwich, 9·3 in Wolverhampton, 7·7 in Nottingham, and 7·0 in Sheffield ; among the 50 other large town districts, 12·8 in Northampton, 9·8 in Newport (Monmouth), and 7·6 in Dover ; in other town registration sub-districts, 23·8 in Bideford, 15·2 in Tredegar, 14·9 in Bridport, 14·5 in Bishop Auckland, 14·0 in Cadoxton, 13·5 in Radford, 12·8 in Castleford, 12·4 in Malton, 12·0 in Yeovil, and 11·9 in Llantrisant.

With regard to the distribution of the fatal cases of the other zymotic diseases it may be briefly remarked that measles was proportionately most prevalent in London, Staffordshire, Lancashire, Durham, and the West Riding of Yorkshire ; the districts of Bolton and Cardiff showed excessive numbers. Although the deaths from scarlet fever were less numerous than in recent quarters, the disease was more or less epidemic in parts of Staffordshire, Lancashire, the West Riding of Yorkshire, Durham and Cumberland ; Wolstanton, Stoke-upon-Trent, Bury, Burnley, Todmorden and Whitehaven were among the districts which suffered from exceptional prevalence of this disease. The deaths from whooping-cough were exceptionally high last quarter, and the disease was especially fatal in London, Liverpool, Manchester, and West Bromwich. The death-rate from fever was considerably lower than in recent corresponding quarters, but, as usual, showed an excess in the manufacturing districts of Lancashire and Yorkshire ; in Nottinghamshire the deaths from fever had considerably declined from the high number returned in the last three months of 1871, but they were again excessive ; the fatality from fever was exceptionally high in the borough of Sunderland and in Strood (Kent), Whitechurch (Hants), Radford, Yarm, and Llanelly sub-districts. A considerable reduction in the death-rate from fever has occurred in recent years, and has been especially conspicuous in London. There is little doubt but that this result is directly due to an increased efficiency in sanitary supervision. When the whole country shall have been brought under the organised control of sanitary authorities we may hope for a still more strongly marked decline in the fatality from zymotic diseases. So long, however, as the appointment of health officers, even in large towns, is optional, and so long as rural districts are not formed into organised sanitary districts, it is almost futile to hope for a more rapid decrease of the waste of life from these causes which is continually occurring around us.

During the three months ending 31st March last 6193 deaths in England and Wales, or 4·6 per cent. of the total deaths were registered upon the information of the coroners, being inquest cases, against 6789 and 6910 in the corresponding quarters of 1870 and 1871. The deaths referred to different forms of violence during last quarter were 3885, and corresponded with the number in the first three months of 1871 ; the proportion to total deaths was 2·9 per cent.

In the large public institutions of England and Wales, including workhouses, hospitals, and public lunatic asylums, 12,058 deaths were recorded last quarter against 13,394 in the corresponding period of 1871 ; the proportion was 8·9 per cent. of the total deaths, while in the first quarter of 1871 it was 9·7 per cent. ; this decrease occurred principally in the deaths in workhouses, and was due to the mild weather which favourably influenced the death-rate among elderly people.

Second Quarter.—April, May, June.

In the UNITED KINGDOM the births of 279,543 children, and the deaths of 165,933 persons of both sexes, were registered in the three months

ending 30th June 1872. The natural increase of population was thus 113,610.

The registered number of persons married in the quarter ending 30th June 1872, was 124,664.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriage-rate of the spring quarter of the year has been high, and thus implies that the country has been prosperous. Though the prices of the necessaries of life have risen, or rather though the value of money has fallen, it has not interrupted the progress of the workmen engaged in manufactories, mines, and trades, as their wages have also risen. The births of the April, May, and June quarter were an average number: the deaths were below the average. Although small-pox still prevailed and whooping-cough was fatal, there was a general abatement of deaths from zymotic disease, and notably from scarlet fever and from fever. Thus the returns present generally favourable results; the community has been comparatively healthy and prosperous. Still much remains to be done in the supply of pure water and of pure air; and in the arrangements for the purification of both town and country.

Marriages.—In the second quarter of the year the number of persons married was 100,760, or marriage went on at the annual rate of 17·5 per 1000 living. The increase upon the previous corresponding quarter was 3098 in the number of persons married, and ·4 in the marriage-rate. This increase was unequally distributed amongst the eleven Registration Divisions, the numbers in the North-western and Northern Divisions having largely exceeded their averages for the corresponding quarter in the three previous years, while the excess in the South-eastern and South-western Divisions was very slight. Of the counties, Northamptonshire, Monmouthshire, Bedfordshire, Staffordshire, Durham, Cheshire, Leicestershire, Lancashire, and Westmorland, showed the greatest proportional increase. A decline was exhibited in Berkshire, Buckinghamshire, Cambridgeshire, Devonshire, Herefordshire, and North Wales.

Births.—In the second or spring quarter of the year 1872, the births of 208,790 children born alive were registered. The increase upon the number registered in the corresponding quarter of the previous year was 7625. The birth-rate was 36·3 per 1000, which is identical with the average rate for the spring quarter in the ten preceding years, but ·8 above the rate for the June quarter of 1871. Compared with the average number in the second quarter of the three previous years, the number of births in each of the eleven Divisions showed an increase, such increase being proportionally greatest in the Northern and least in the South-western Division. In the county of Durham the number of births was 14 per cent. above the average; in Dorsetshire it was 3 per cent. below the average.

Increase of Population.—The excess of births over deaths amounted to 87,955 in the three months, being at the rate of 967 per day. This large natural increase of population was, however, to a considerable extent counterbalanced by emigration, 89,213 persons of British origin having sailed during the quarter from ports at which emigration officers are stationed. Of these 89,213 emigrants, 40,423 were English, 9168 Scotch, and 39,622 Irish; in the second quarter of 1871 the number of British emigrants was but 83,399.

Prices, Pauperism, and the Weather.—A slight rise occurred in the price of wheat, the average price per quarter being 56s. 8d. in the three months ending 30th June last, against 55s. 4d. in the previous three months. In the corresponding quarter of 1871 the average price was 59s. 9d.

Potatoes were dear, the average price per ton at the Waterside Market, Southwark, being 137*s.*, or 73*s.* 6*d.* per ton higher than at the same period of last year.

The upward tendency in the price of meat still continued. The average prices of beef and mutton, by the carcase, at the Metropolitan Meat Market were 6½*d.* and 7½*d.* per lb. respectively, showing a further rise of ¼*d.* per lb. in each kind of meat upon the high prices which prevailed in the previous quarter.

The returns of pauperism were again favourable, showing a decline in the number both of in-door and out-door paupers. The average number of those receiving in-door relief on the last day of each week in the quarter was 134,422, a smaller number than in any corresponding quarter since 1867, and of those receiving out-door relief 724,792, or less than in any corresponding quarter since 1861.

The weather during the quarter was very changeable; periods of excessive and deficient temperature alternated. The mean temperature in April was 2°·3 in excess of the average in 101 years. In May it was 1°·7 below the average, the nights being especially cold. In June the weather was again warm, the mean temperature being 1° above the average. The mean temperature of the whole quarter was 52°·8, or 0°·5 above the average. The lowest reading of the barometer during the quarter was 28·9 in. on 21st April, and the highest 30·3 in. on 6th of the same month. Heavy thunderstorms occurred about the middle of June.

The rain-fall of the quarter at Greenwich was 5·7 in., and was almost identical with the average in 57 years; of this, one inch fell in April, 3·1 in. in May, and 1·6 in. in June. The fall in May was almost an inch in excess, while it was below the average in both April and June.

State of the Public Health; Deaths.—In the second or spring quarter of 1872, ending 30th June, 120,835 deaths were registered in England and Wales; after making due allowance for increase of population this number showed a decline from those returned in the corresponding periods of the three years 1869–70–71. But for the continued and general fatal prevalence of small-pox the mortality during last quarter would have been unusually low. The annual death-rate was equal to 21·0 per 1000 of the estimated population, against 21·8, the average rate in the ten previous corresponding quarters; in the second quarters of those ten years 1862–71 the death-rate ranged from 20·2 in 1868 to 24·2 in 1866.

In the eleven Registration Divisions of England and Wales the annual death-rate last quarter ranged from 17·0 and 17·8 per 1000 respectively in the agricultural counties of the South-eastern and Eastern Divisions, to 23·7 in Yorkshire and 23·8 in the North-western counties, Lancashire and Cheshire. The deaths returned in the three months ending June were below the average numbers for the three previous corresponding quarters in London and in Divisions 2, 3, 4, and 5; an excess was, however, shown in the Midland, Northern, and Welsh Divisions, where the greatest fatality from small-pox occurred.

In the chief town districts of England and Wales, comprising a population of 13 millions of persons, the annual death-rate last quarter was equal to 22·6 per 1000. In the remaining and principally rural population of about 10 millions, the death-rate did not exceed 18·8 per 1000. The urban rate was 0·8 and the rural rate 1·0 per 1000 below the average rates in the corresponding quarter of the ten years 1862–71. Only twice in these ten years (in 1867 and 1868) was the urban death-rate in the second quarter of the year so low as during the three months ending last June; in the second quarter of 1868 the rural death-rate was 17·4 per 1000, but with this exception the rate in this portion of each of the ten years 1862–71 was higher than that which prevailed last quarter.

The 120,835 deaths in England and Wales during last quarter included 27,351 or 22·6 per cent. of infants under one year of age, and 28,466 or 23·6 per cent. of persons aged 60 years and upwards; each of these proportions showed a slight increase upon those which prevailed in the corresponding quarter of last year. Infant mortality measured by the proportion of deaths under one year of age to births registered was 13·1 per cent., against 13·4 and 13·3 in the two previous corresponding quarters.

The seven principal diseases of the zymotic class caused 19,336 deaths in England and Wales during the three months ending June last, against 18,120 and 21,420 in the second quarters of 1870 and 1871; of these 19,336 deaths last quarter 6521 were referred to small-pox, 2530 to measles, 2206 to scarlet fever, 475 to diphtheria, 3415 to whooping-cough, 2745 to fever, and 1744 to diarrhœa. It is worthy of remark that, excluding the fatal cases of small-pox, the deaths resulting from these principal zymotic diseases were 12,815 last quarter, against 17,674 and 14,408 in the corresponding periods of 1870 and 1871. The 19,336 deaths from the seven diseases were equal to an annual rate of 3·4 per 1000 of the estimated population, against 3·2 and 3·8 in the two previous corresponding quarters.

Small-pox is still a fatal and prevailing epidemic in England and Wales. During the ten years 1860-69 the annual deaths from this disease ranged from 7684 in 1864 to 1565 in 1869; and the average quarterly number in the ten years was 873. Last quarter the fatal cases were 6521, a decline it is true of 1199 from those in the first quarter of the year, but with one other exception a higher number than were returned in any quarter of the past 31 years; they were equal to an annual rate of 1·1 per 1000 persons living. The present epidemic, which was first severely fatal in London and Liverpool, reached its climax in those town districts early in 1871, since when it has steadily declined; but with few exceptions all the large towns in each of the Registration Divisions have since suffered more or less severely. Norwich and Ipswich have experienced severe epidemics in the Eastern counties; Plymouth, Portsmouth, Southampton, and Dover in the South; Wolverhampton, Nottingham, Leicester, Northampton, and Dudley in the Midland counties; Sheffield, Auckland, Durham, Newcastle-upon-Tyne, Sunderland, and Tynemouth in the Northern counties; and Tredegar, Newport, Merthyr Tydfil, Swansea, and Neath in Monmouthshire and Wales. Each of these places has in turn become, what may be termed, a centre of infection, from which the disease has spread to smaller towns and rural districts within a large radius, until the epidemic has been more or less felt in all parts of England and Wales. The divisional totals of deaths from small-pox last quarter showed a decline upon recent quarterly numbers in all parts of the country except in the South-eastern counties, and in the 6th and 7th Divisions including most of the Midland counties; in each of the other Divisions the maximum fatality from the epidemic would appear to have been passed. Of the 1483 deaths from small-pox in the 6th Division last quarter, 1028 occurred in Staffordshire, including 489 in Dudley, and 344 in Walsall registration Districts; the fatality from the disease was also very severe in the parish of Kingswinford in the District of Stourbridge. The increased fatality in the 7th Division was principally confined to Leicester, Ashby-de-la-Zouch, and Basford Districts; in Ashby-de-la-Zouch the epidemic was most fatal in Whitwick sub-district, which, it will be remembered, suffered from a severe epidemic of enteric fever during the summer of 1871; of 154 deaths from small-pox in Basford District, 44 occurred in Greasley sub-district, and no less than 81 in the parish of Bulwell, which at the recent Census did not contain a population of more than 4276 persons. In South Wales the epidemic showed in-

creased prevalence last quarter, especially in Pontypridd and Merthyr Tydfil Districts, in which 419 fatal cases were reported, against 241 in the first quarter of the year; the fatality, however, had considerably declined in Neath, and also in the county of Monmouth.

The 2530 deaths referred last quarter to measles in England and Wales showed a slight further increase upon the numbers returned in the corresponding quarters of 1870 and 1871; a large portion of this increase occurred in London and the West Riding of Yorkshire, the disease being very fatal in Bradford; local epidemics of measles also appear to have prevailed in Croydon, Rickmansworth, Alverstoke, and Saltash. Scarlet fever was severely epidemic during 1870, and caused 11,746 deaths in the last quarter of that year, since which the quarterly numbers have rapidly declined, and the 2206 fatal cases returned last quarter were considerably below the number registered in any quarter since the end of 1869; this decline has been general throughout the whole of England and Wales, but the disease was severely epidemic last quarter in Burnley, Dukinfield, and Todmorden, and sharp outbreaks also occurred in many smaller towns and villages, among which may be mentioned Cranbrook, St. Albans, Handborough (Oxon), Wolverton, Ampthill, Bilston, Boston, and Holyhead; these outbreaks could doubtless be traced to defects in the sanitary condition of these places, which should be discovered and remedied. The fatality from diphtheria, which usually rises or falls with that of scarlet fever, was below the average last quarter. The 3415 deaths referred to whooping-cough, although showing a decline of 1284 from those returned in the preceding three months, showed an excess of more than 1200 upon the number in the second quarter of 1871; the fatality from this disease was general, but the proportionally largest excess occurred in London, where 959 deaths were referred to it against 518 in the corresponding three months of 1871. The deaths from diarrhoea last quarter were lower than in the second quarters either of 1870 or 1871; this was probably due to the moderate temperature which prevailed during May and the greater part of June. From simple cholera, or choleraic diarrhoea, 33 deaths resulted, against 26 in the second quarter of 1871. Concerning the principal zymotic diseases, it only now remains to add a few remarks upon the fatality from the various forms of continued fever in England and Wales last quarter. Mortality from fever affords undeniable evidence of an unsatisfactory sanitary condition. It is gratifying therefore to find that the deaths referred to fever, which in the second quarters of 1870 and 1871 had been 3524 and 3269, further declined to 2745 last quarter; compared with the numbers in the three months ending 30th June 1871, those returned last quarter showed a decline in each of the Registration Divisions, except the fourth, containing the Eastern counties. In London, where the sanitary superintendence is perhaps somewhat in advance of the greater part of the country, the decline in the death-rate from fever has been rapid and continuous in recent years. Staffordshire, the manufacturing districts of Lancashire and Yorkshire, and the mining population of the Northern counties still, however, show excessive rates from fever. In the sub-district of Ashton-in-Makerfield (Wigan) 12 deaths from fever were returned last quarter, in addition to 14 from measles, raising the total deaths to 87 in a population of 7463 (at the 1871 Census) against an average of 45 in the three preceding corresponding quarters. Fever was also exceptionally fatal in Walsall and Bilston, and small local outbreaks occurred at Whitchurch (Hants), Bradford (Wilts), and Camelford. So long as any portion of the country, whether urban or rural, is allowed to remain without the control of intelligent sanitary organization and supervision, will this waste of life from fever, and other forms of zymotic disease, be continually reported. The force of public opinion in recent years has done much to improve the sanitary condition of many of our large towns, in spite of the rapidly increasing difficulties arising from the

sewage and water problems; in the smaller towns and villages, however, the same progress has not been made, and it is to their formation into working sanitary districts that we must look for any considerable amelioration in their condition.

During the three months ending 30th June last, 6155 deaths in England and Wales, or 5·1 per cent. of the total deaths, were registered upon the information of the coroners, being inquest cases, against 5807 and 5908 in the second quarters of 1870 and 1871. The deaths referred to different forms of violence during last quarter were 4027, or 3·3 per cent. of the total deaths; in the corresponding period of 1871 the number was 3926, or 3·2 per cent. of the deaths from all causes.

In the large public institutions of England and Wales, including workhouses, hospitals, and lunatic asylums, 11,005, or 9·1 per cent. of the total deaths, were recorded; in the second quarter of 1871 the number of these deaths in institutions was 12,144, or 10·0 per cent. of the total deaths; this decrease principally occurred in the workhouses, and was probably in great measure due to the general decline of pauperism.

Third Quarter.—July, August, September.

In the UNITED KINGDOM the births of 264,879 children, and the deaths of 155,295 persons of both sexes, were registered in the three months ending 30th September 1872. The natural increase of population was thus 109,584.

The registered number of persons married in the quarter ending 30th September 1872, was 122,232.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriage-rate, which had fallen to a low ebb three years ago, rose after the winter of 1871, and in the last summer quarter ending in September was considerably above the average; the young took a cheerful view of their prospects, and many new families were founded by marriages. The birth-rate of the three months of July, August, and September exceeded the average of the season; and the death-rate was low both in town and country. So the Public Health is growing more satisfactory, and leads us to hope for still further improvement from more effectual sanitary measures. The disasters of the floods and of excessive rain-falls are more than compensated by the better water supply. Against the consequences of the loss of a portion of the potato crop some provision should be made by the supply of vegetables, or of acids, otherwise scurvy may prevail.

Marriages.—In the quarter ending 30th September 1872, 99,636 persons were married, or 6564 more than in the corresponding quarter of 1871. The annual rate was 17·1 per 1000 against 16·2 in the September quarter of 1871, the average rate for the third quarters of the ten years 1862–71 being 16·3. The mining districts of Durham and Monmouthshire, as was to be expected, again showed the greatest proportional increase upon the average number of marriages for the three previous corresponding quarters. In Huntingdonshire, Essex, Bedfordshire, Northumberland, Cumberland, Staffordshire, and the extra-metropolitan part of Middlesex, the increase was also large. The marriages in Wiltshire and Herefordshire were 11 and 16 per cent. respectively below the average for the third quarters of the three previous years. The counties of Kent (extra-metropolitan), Sussex, Dorset, Somerset, Worcester, Rutland, and Westmorland also exhibited a decrease. In London the increase was equal to 8 per cent.

Births.—In the quarter ending 30th September 1872, 201,746 births were registered, or 8475 more than in the September quarter of 1871. The birth-rate was 34·7 per 1000, or 1·0 higher than the rate in the

previous corresponding quarter, and $\cdot 6$ higher than the average rate for the summer quarter in the ten preceding years. In each of the eleven Divisions, except the South-western, the number of births was greater than the average for the third quarter in the three previous years. The greatest excess was again shown in the Northern Division, particularly in the county of Durham. In Essex, also, the births largely exceeded the average.

Increase of Population.—The excess of births over deaths during the 92 days was 82,819, or at the rate of 900 daily. The counteracting force of emigration, however, diminished the effect of this natural increase of population, 56,778 persons of British origin having sailed during the three months from ports at which emigration officers are stationed. Of these 56,778 emigrants, 36,135 were English, 5,309 Scotch, and 15,334 Irish. The destination of 42,060 was the United States, of 9534 British North America, of 3587 the Australian colonies, and the remaining 1597 were distributed amongst other places.

Prices, Pauperism, and the Weather.—There has been for some time a marked general rise of prices. The price of wheat again rose slightly, the average for the three months being 58s. 11d. per quarter, against 56s. 8d. in the previous three months. In the corresponding quarter of 1871 the average price was 57s. 9d.

Potatoes (best Regents) averaged 119s. per ton at the water-side market, Southwark, being 50s. per ton dearer than in the September quarter of last year.

A further rise occurred in the price of meat. The average price of beef, by the carcase at the Metropolitan Meat Market, was 6 $\frac{3}{4}$ d., and of mutton 7 $\frac{3}{4}$ d. per lb. In the previous quarter the average prices were 6 $\frac{1}{4}$ d. and 7 $\frac{3}{4}$ d. respectively.

Pauperism continued to decline. The returns for the past quarter, when compared with those for the quarter ending 30th September 1871, show a decrease of 5645, or 4 \cdot 3 per cent. in the average number of indoor paupers, and of 87,897, or 11 \cdot 4 per cent. in the average number of out-door paupers, relieved on the last day of each week.

The weather during the whole quarter was changeable. The mean temperature in July, notwithstanding a cold period which lasted from the 8th to the 18th, was 3 $^{\circ}$.4 above the average, the warmest period in the whole quarter being the 11 days from the 19th to the 29th July, during which the average daily excess of temperature was 7 $^{\circ}$.9. The first half of August was cold and wet, but during the latter part of that month and the early part of September the temperature was higher, though the weather was unsettled. From the 17th September to the end of the quarter rain fell generally and the daily temperature was deficient. The most remarkable feature of the quarter was the frequency of thunderstorms. In July they were prevalent from the 6th to the 14th, and from the 21st to the end of the month; in August from the 5th to the 12th, and from the 21st to the end of the month; in September from the 2d to the 6th, and from the 19th to the 29th. In consequence of the changeable weather the hay harvest was not completed in July, and the heavy rains and frequent thunderstorms seriously interrupted the progress of the corn harvest in August and September.

The rain-fall of the quarter at Greenwich was only 6 \cdot 5 inches, and 0 \cdot 8 in. below the average in 57 years. It was nearly the average in July, exceeded it by 0 \cdot 3 in. in August, and was 1 in. deficient in September. The rain-fall in the country generally was 10 \cdot 1 inches; the largest excess occurring in the districts north of latitude 52 $^{\circ}$. In Salford as much as 16 \cdot 5 inches fell.

State of the Public Health; Deaths.—In the third or summer quarter of this year, 118,927 deaths were registered; these were 1132 below

the average number in the corresponding three months of the three years 1869-70-71, without taking into account the increase of population. The annual death-rate was equal to 20.5 per 1000 of the estimated population, against 21.1 the average rate in the third quarters of the ten years 1862-71; in those years the summer death-rate ranged from 18.0 and 19.9, in 1862 and 1867, to 23.7 in the remarkably hot summer of 1868.

In the eleven Registration Divisions of England and Wales the annual death-rate last quarter ranged from 16.1 and 16.9 per 1000 in the agricultural counties of the South-western and South-eastern Divisions, to 23.9 and 24.0 in the principally manufacturing counties of the York and North-western Divisions.

Among rather more than 13 millions of persons living in the chief town districts of England and Wales the annual death-rate was 23.1 per 1000, while in the remaining and principally rural population of about 10 millions the death-rate did not exceed 17.0 per 1000. The urban rate was 0.7 and the rural rate 0.5 per 1000 below the average rates in the corresponding quarters of the ten years 1862-71. Only in 1862 and 1867 of the above ten years was the English urban death-rate so low during the third quarter of the year as it was in the three months ending September last; the rural rate was lower in the third quarters of 1862, 1867, and 1869 than it was last quarter.

The 118,927 deaths in England and Wales included 36,615 or 30.8 per cent. of infants under one year of age, and 24,250 or 20.4 per cent. of persons aged 60 years and upwards; the proportion of infant mortality was almost identical with that which prevailed in the third quarter of last year, while that of elderly persons showed an increase of 1.0 per cent. To each 100 births registered last quarter 18.1 deaths of children under one year of age were recorded; the proportion was 20.0 and 19.4 per cent. respectively in the corresponding periods of 1870 and 1871.

The seven principal diseases of the zymotic class caused 27,428 deaths, against 33,963 and 31,388 in the third quarters of 1870 and 1871; of the 27,428 deaths, 2953 were referred to small-pox, 1267 to measles, 2423 to scarlet fever, 406 to diphtheria, 2503 to whooping-cough, 3195 to different forms of fever, and 14,681 to diarrhœa. These 27,428 deaths, of which more than half resulted from diarrhœa, principally infantile, were equal to an annual rate of 4.7 per 1000 persons estimated to be living, against 6.0 and 5.5 in the two previous corresponding quarters.

The fatality from diarrhœa, which is directly influenced by the temperature and rain-fall, may be said in the present day to govern the rate of mortality during the summer or third quarter of the year. The fatality from diarrhœa reached its maximum at the beginning of August, somewhat earlier than usual, owing to the hot weather which prevailed at the end of July; the temperature during the latter part of the quarter was below the average, and the fatality from diarrhœa declined rapidly. The 14,681 deaths reported from diarrhœa during the three months ending September were equal to an annual rate of 2.5 per 1000 persons estimated to be living, against 3.1 and 2.8 respectively in the third quarters of 1870 and 1871. In the 18 large English towns furnishing weekly returns the death-rate from diarrhœa averaged 4.4 per 1000, in the 50 other large towns ranking next in size it was 3.5, and in the whole of England and Wales exclusive of these 68 towns the rate did not exceed 1.5 per 1000. From these figures it is evident that the fatality from diarrhœa is far more excessive in urban than in rural populations; in the agricultural counties of the South-western Division, for instance, the diarrhœal death-rate was only 0.9 per 1000, while it was 3.9 per 1000, or more than four times as great, in the manufacturing counties of Lancashire and Cheshire forming the North-western Division. According to the proportion which prevailed in 1870, 11,862 or 80.8 per cent. of the total deaths from diarrhœa were of infants under two years of age; these deaths therefore exercised an

important influence upon the infant mortality. In presently considering the variations in the death-rate from diarrhoea in the several towns, it will appear that the prevailing branches of industry in some of the principal town centres exercise some effect upon this fatality.

To simple cholera, or choleraic diarrhoea, 471 deaths in England and Wales were referred last quarter, against 527 in the corresponding three months of last year; of these 163 occurred in London.

The epidemic of small-pox, which has prevailed so severely since the latter part of 1870, caused no less than 23,126 deaths during the four quarters of 1871, and 7720 and 6521, respectively, in the first two quarters of the present year. During the three months ending 30th September last the fatal cases of this disease further declined to 2953; this reduced number, however, showed a considerable excess, as the average quarterly number during 1870, notwithstanding a marked increase in the last quarter, did not exceed 655. The deaths from small-pox showed a large decrease upon the numbers returned in recent quarters in each of the Registration Divisions, but Oxfordshire, Dorsetshire, and Westmorland are the only counties in which no fatal case was reported in the three months. In Cornwall and Cumberland the deaths from small-pox showed an increase upon those in the preceding three months, owing to a greater fatality in Penzance and Whitehaven. The other principal places in which the mortality from small-pox was still excessive last quarter were Portsmouth, Dover, Ipswich, Dudley, Whitwick, and Ystradyfodwg (Glamorganshire).

The deaths referred to measles, scarlet fever, and diphtheria were below the numbers returned in either of the two preceding corresponding quarters; the fatal cases of whooping-cough, which had been excessive in the first two quarters of the year, declined in the three months ending 30th September, although the 2503 deaths from this disease exceeded the numbers returned in the corresponding quarters of 1870 and 1871. The 3195 deaths referred to different forms of fever, although exceeding by nearly 500 the number in the second quarter of this year, were lower than those in the third quarters of 1870 and 1871, which were 4635 and 3362 respectively. The mortality from fever has considerably declined in England since 1865, when it was at the rate of 1·1 per 1000 persons living; last year it was less than 0·7 per 1000, and the returns for this year show a further considerable decrease. This decline in the death-rate from fever is satisfactory evidence of decided sanitary progress.

The fatality from zymotic diseases is naturally greatest in the large town centres, where it is fostered by over-crowding, impure air, and impure water. In 18 of the largest English towns the annual death-rate from the seven principal diseases of this class (including diarrhoea) was equal to 7·0 per 1000; in 50 other large, but smaller, towns it was 6·1; and in the whole of England and Wales, exclusive of these 68 towns, the rate was only 3·5. It must always, however, be borne in mind that very many of our smaller towns and villages exhibit in their death-returns the results of an unfavourable sanitary condition, which it is to be hoped will, when the sanitary organization contemplated by the recent Public Health Act shall be completed, stand a fair chance of improvement. Till now many small towns and villages have been entirely without any sanitary authorities, and epidemic diseases have at frequent intervals levied their fatal contributions from the inhabitants, without attracting more than passing local attention. A glance through the sub-district returns in the present Quarterly Return will show that measles was unusually fatal in Brentford and Carnarvon; scarlet fever in Rye (Sussex), Steeple Bumpstead (Essex), Bishop's Castle (Salop), and Aberystwith; St. Austell suffered from whooping-cough, and South Hinksey (Berks) from diphtheria; fever, principally of the enteric type, was fatally prevalent in Liskeard (Cornwall), Hawkesbury (Gloster), Hucknall (Notte), and Ovenden township near Halifax. The most remarkable outbreak of

zymotic disease in the quarter was the epidemic of scarlet fever in Oldham, which resulted in 264 deaths within the registration district of that name, including 217 within the municipal borough; the severity of the epidemic has but slightly abated since the end of the quarter.

During the three months 6209 deaths in England and Wales, or 5·2 per cent. of the total deaths, were registered upon the information of the Coroners, against 5526 and 6032 in the corresponding three months of 1870 and 1871. To different forms of violence 4331 or 3·6 per cent. of the total deaths were referred in the three months; in the corresponding period of 1871 the number was 4202, or 3·5 per cent. of the deaths from all causes.

In the large public institutions, including workhouses, hospitals, and lunatic asylums, 9301 or 7·8 per cent. of the total deaths were recorded; this is the lowest number of institution deaths returned in any quarter since the third quarter of 1870, and is doubtless partly due to the marked decline in the fatality from small-pox, which has since the latter part of 1870 considerably swelled the numbers of deaths both in hospitals and workhouses. The decline of pauperism has also doubtless contributed to the decrease in the workhouse deaths.

Fourth Quarter.—October, November, December.

In the UNITED KINGDOM the births of 270,172 children, and the deaths of 158,744 persons of both sexes, were registered in the three months ending 31st December 1872. The natural increase of population was thus 111,428.

The registered number of persons married in the quarter ending 31st December 1872, was 147,718.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriage-rate has completely recovered from the depression of the year 1869, and through all the quarters of the year 1872 exceeded the averages of previous years. Births, which had fallen off in 1871, rose again, and exceeded the average number in the year 1872, and notably in its Christmas quarter. The mortality for the year was lower than in any of the last twelve years, and in the Christmas quarter the deaths were only nine in ten of the average number. The reduction of the mortality was greatest in the cold quarters of the year, when the temperature was higher than usual, in the town districts where sanitary improvements have made some progress, and in the sensitive class of acute zymotic diseases. Not only did the population suffer less from small-pox, but also less from measles and diphtheria. Whooping-cough showed some inclination to activity, but fever declined, and scarlet-fever, the plague of the young, failed to reap its accustomed harvest of children. The sickness from these diseases probably declined nearly as much as the deaths. The higher night temperature and the abundant rain-fall undoubtedly contributed to the diminution of the death-toll of the kingdom.

Marriages.—The marriages in the fourth quarter of the year 1872 were more numerous than in any preceding quarter, 121,060 persons having been married in the three months ending 31st December last. The marriage-rate was 20·8 per 1000 persons living, or 0·9 above the mean rate for the fourth quarter in the ten years 1863-72: during those years it was exceeded only once, namely, in the December quarter of 1865. Compared with the average numbers for the corresponding quarter in the three previous years, the marriages in the counties of Monmouth and Durham again showed the greatest increase. In Bedfordshire, Northamptonshire, Cumberland, Nottinghamshire, the East Riding of Yorkshire,

and Northumberland the numbers also largely exceeded the average, while Westmoreland, Herefordshire, and Devonshire exhibited a considerable decrease. A comparison, however, with the numbers of marriages registered in the corresponding quarter of 1871 is less favourable, as an actual decrease is shown in London and in 16 of the counties, while in seven other counties the numbers are nearly identical with those returned for the previous corresponding quarter. In most of these 23 counties the population is engaged principally in agriculture, but among them are also included the counties of Cornwall, Gloucester, Worcester, Warwick, and Cheshire, which contain several populous mining and manufacturing districts.

Births.—The births registered in the quarter ending 31st December last were 206,619, exceeding the number in the fourth quarter of 1871 by 13,150. The birth-rate, 35·5, was higher than in any previous corresponding quarter, and 1·5 above the average rate for the December quarter in the ten years 1862–71. The increase over the average for the three previous corresponding quarters was again much greater in Durham than in any other county; of the remaining counties the largest increase was shown in Warwickshire and Lancashire. Shropshire was the only county in which the births were below the average, but the increase in Devonshire, Herefordshire, and Lincolnshire was very slight. The average birth-rate in the eighteen towns furnishing weekly returns was 37·3, or 1·9 above the rate for the whole of England and Wales. In London the rate was only 35·1. Four others of these towns showed lower birth-rates, the lowest being 32·5 in Norwich. In all the thirteen other towns the rates exceeded the general rate for England and Wales, the highest rate being 48·2 in Sunderland. In the fifty towns ranking next in order of magnitude the average birth-rate was 37·2 per 1000, or nearly the same as in the eighteen towns; the rates in the several towns ranging from 25·8 in Bath and 26·2 in Cheltenham, to 49·5 in Gateshead and 51·7 in Wigan.

Increase of Population.—In consequence of the high birth-rate and the low death-rate in the quarter, the natural increase of the population was large, the excess of births over deaths amounting to 89,068. Emigration, however, was also more active than is usual in the last quarter of the year, 37,855 persons of British origin having sailed during the three months from ports at which emigration officers are stationed, against 30,753 in the last quarter of 1871. Of these 37,855 emigrants, 25,032 were English, 3,144 Scotch, and 9,679 Irish. The destination of 26,716 was the United States, of 2,311 British North America, of 5,712 the Australian colonies, and the remaining 3,116 were distributed amongst other places. Since 1868 English and Scotch emigrants have increased so as generally to exceed the Irish in number.

Prices, Pauperism, and the Weather.—The high prices of the principal necessaries of life were still maintained. Wheat averaged 57s. 3d. per quarter, or 1s. a quarter more than in the corresponding period of 1871. The average price per ton of potatoes (best Regents) at the Waterside market, Southwark, was 170s. or nearly double the average price in the three months ending 31st December 1871. Beef was slightly dearer and mutton slightly cheaper than in the previous quarter. The average price of beef by the carcass at the Metropolitan meat market last quarter was 6½d. and of mutton 7¾d. per lb. In the quarter ending 30th September the average prices per lb. were 6½d. and 7¾d., while in the December quarter of 1862 they were 5½d. and 6d. respectively.

The returns of pauperism again showed a considerable decline, compared with those for the December quarters of 1870 and 1871. The average number of in-door paupers relieved on the last day of each week during the quarter was 138,662 and of those receiving out-door relief 675,644.

or 6 and 29 per 1000 respectively of the total population. In the previous corresponding quarter the numbers were 141,027 and 759,666 respectively; the decrease of in-door paupers being equal to 1·7 per cent. and of out-door paupers to 12·4 per cent.

Till the 24th October the weather was cold, the average deficiency of daily temperature being $3\frac{1}{2}^{\circ}$. Then followed a warm period till the 9th November, with about an equal average daily excess of temperature. From the 10th to the 19th November was a cold period during which the average daily deficiency was $5\frac{1}{4}^{\circ}$. A period of 14 days warm weather succeeded, in which the average daily excess was 6° , followed by 16 days of changeable weather from the 3d to the 19th December, after which an extraordinarily warm period set in on the 20th, and continued to the end of the year. During this last period the average daily excess of temperature was more than 9° . The mean temperature in the whole quarter was $45^{\circ}\cdot 3$, or $1^{\circ}\cdot 7$ above the average of 101 years. In October it was $1^{\circ}\cdot 8$ in defect, and in November and December $3^{\circ}\cdot 0$ and $3^{\circ}\cdot 8$ respectively in excess. The most remarkable feature of the weather during the quarter was the frequency and abundance of rain. Rain fell at Greenwich on 67 out of the 92 days, a greater number than in any previous corresponding period since 1815. In Guernsey rain fell on 80 days, and at Stonyhurst in Lancashire on every day in the three months except two. The total fall was large, amounting at Greenwich to 11·32 inches, a quantity which has only once been exceeded during the corresponding period in the last 57 years, namely in 1821, when the fall was 11·47 inches. Last quarter between latitudes 50° and 51° the rainfall averaged about 16·5 inches, and 15·5 inches between latitudes 54° and 55° . The excess over the average of 57 years was 1·5 inches in October, 0·6 in November, and 2·1 in December.

State of the Public Health; Deaths.—In the fourth or autumn quarter of last year 117,551 deaths were registered, or 12,002 less than the average number in the corresponding three months of the three years 1869–70–71, uncorrected for increase of population. The annual death-rate was 20·2 per 1000, and 2·2 per 1000 below the average rate in the fourth quarters of the ten years 1862–71. During the 35 years 1838–72 the death-rate in the last three months of the year has only twice been lower than in the quarter ending 31st December last; in 1845 the rate was 19·1, and in 1856 20·0. In the other years of this period the annual death-rate in the December quarter ranged upwards to 24·1 in 1858 and 25·5 in 1846.

In the eleven Registration Divisions the annual death-rate last quarter ranged from 16·2 and 17·8 in the agricultural counties of the South-eastern and South-western Divisions, to 23·8 and 22·5 respectively in the North-western and York Divisions, comprising the manufacturing districts of Lancashire and Cheshire, and of Yorkshire.

In the chief town districts, containing a population estimated at rather more than 13 millions, the death-rate was 22·2 per 1000, while in the remaining and principally rural population of about 10 millions the death-rate did not exceed 17·6 per 1000. The urban rate was 2·9, and the rural rate 1·2 per 1000 below their average rates in the corresponding quarters of the ten years 1862–71; in the December quarters of those years the lowest urban rate was 23·9 in 1867, which was 1·7 above the rate for last quarter, while the rural rate in 1867 was 17·7, and nearly corresponded with last quarter's rate. It is evident that the generally high temperature and abundant rain during the last three months of 1872 exercised a more beneficial influence upon the public health in town than in rural districts. A hard winter is most fatal among the dwellers in towns, who suffer from the extremes of poverty; and abundant rain not only mechanically cleanses the streets and sewers, but purifies the atmosphere and carries off zymotic exhalations which generate disease. Although the remarkably low death-rate in town districts last quarter may

be principally due to the somewhat unusual meteorological conditions which prevailed, it may be safe to assume that a portion of the improvement in their health is permanent, and is the result of the general awakening to the importance of sanitary measures which has been so conspicuous in the last few years.

The meteorological influence on the mortality at different ages appears to have been unequal. Of the total deaths 24·0 per cent. were of infants under one year of age, and 25·4 per cent. of persons aged 60 years and upwards; hence 50·6 per cent. were of children and adults between one and 60 years of age against 55·1 and 53·2 per cent. respectively in the last quarters of 1870 and 1871. The proportion both of infant mortality and of deaths of elderly persons to the total deaths was larger than in the fourth quarters of either 1870 or 1871. The deaths of infants under one year of age to births registered last quarter were 13·6 per cent., against 14·4 and 15·7 in the corresponding periods of the two preceding years. It is evident, therefore, that the largest proportional decrease in the mortality occurred among children and adults between one and 60 years; and from the very marked decline in the fatality from zymotic diseases which must next be noticed, it appears all but certain that the proportional saving of life was greatest among children between one and 10 years of age.

The seven principal diseases of the zymotic class caused only 16,794 deaths, against 25,907 and 26,997 in the fourth quarters of 1870 and 1871; of these 16,794 deaths, 1665 were referred to small-pox, 1341 to measles, 3701 to scarlet fever, 525 to diphtheria, 2182 to whooping-cough, 4023 to different forms of fever, and 3357 to diarrhœa. The deaths from these seven diseases were equal to an annual rate of 2·9 per 1000 of the population against 4·6 and 4·7 in the two previous corresponding quarters. The recent epidemic of small-pox was exceptional, and therefore interferes with the value of these figures for comparison. The deaths reported from measles, scarlatina, diphtheria, whooping-cough, and fever, which were 21,629 and 16,554 in the last quarters of 1870 and 1871, further declined to 11,772 in the three months ending December last. The decline in the fatal cases of these five zymotic diseases from the numbers in the fourth quarter of 1871 was equal to 29 per cent., while the decrease in the deaths from all causes did not exceed 13 per cent.

The fatal cases of small-pox, which had been 7720, 6521, and 2953 in the three first quarters of 1872, further declined to 1665 in the last three months of the year; this was the smallest quarterly number since that in the three months ending December 1870, in which the late epidemic first appeared and caused 1229 deaths. In each of the Registration Divisions, except the South-western, the deaths from small-pox showed a further decline from those in the three preceding quarters of 1872; the 1665 last quarter included 94 in Hampshire, 116 in Cornwall, 292 in Staffordshire, 180 in Worcestershire, 142 in the West Riding of Yorkshire, and 76 in Cumberland, while in the other counties the numbers were comparatively inconsiderable. The following figures point out the principal centres of infection in those counties in which small-pox was fatally prevalent last quarter; the fatal cases in Portsmouth were 85, Helston 62, Penzance 37, Newcastle-under-Lyme 31, West Bromwich 80, Dudley 138, Stourbridge 86, Worcester 54, Rotherham 34, York 31, Cocker mouth 21, and Whitehaven 52.

The deaths from measles, scarlet fever, and diphtheria have not recently been so few in any quarter as during the last three months of 1872. The deaths from measles were 1341 against 1881 and 3763 in the last quarters of 1870 and 1871; those from scarlet fever and diphtheria 4226 against 12,629 and 5133; the fatal cases of fever further declined from 5364 and 4692 to 4023; while those of whooping-cough, although showing a

decrease upon the number returned in the last quarter of 1871, somewhat exceeded those in the same period of 1870. Although the fatality from these diseases had generally declined, an examination of this return in detail will show that local outbreaks of more or less severity occurred in different parts of the country; among others the following instances may be noted. Measles was fatally prevalent in Northampton, Banbury, Norwich, Hinckley, and Carnarvon; scarlet fever in Chesham, Salisbury, Fowey, Bath, Bishops Castle, Oswestry, Bilston, Sedgley, Hayfield, Runcorn, Radcliffe, Oldham, Whitehaven, Aberavon, Aberystwith, and Tregaron. Fever frequently shows the greatest proportional fatality in the small towns and villages, and the present return affords many examples of the truth of this fact; it is impossible however here to do more than to name a few of the cases of the prevalence of fever that arrest the attention in glancing through the local returns:—Battle, Wellingborough, Kettering, Barking Town, Wellington (Somerset), Stapleford, Glossop, Rotherham, Kimberworth, Mexbrough, Kirkleatham, and Llanelli. Outbreaks of fever may invariably be regarded as due to the presence of zymotic poison, which it is the duty of sanitary organization to remove.

The deaths from the seven principal zymotic diseases in England and Wales were equal as before stated to an annual rate of 2·9 per 1000 persons living. In the 18 large English towns the rate from these same diseases was 3·4 per 1000, and in 50 other large but smaller towns it was 3·3; in England and Wales, exclusive of these 68 towns, the zymotic rate was 2·6 per 1000. As these 68 towns include most of the densest town centres, and a population of nearly nine millions, the fact that there the zymotic rate so slightly exceeds the rate for the whole of England and Wales is a marked proof of sanitary progress. When the smaller towns, villages, and rural districts shall all have been brought within the influence of sanitary organization the rural rates may again compare as favourably with urban rates, as they did before the recent improvement in the health of large towns was inaugurated.

During the three months 6500 or 5·5 per cent. of the deaths in England and Wales were registered upon the information of the Coroners, against 4·9 and 4·8 per cent. in the corresponding quarters of 1870 and 1871. The deaths referred to different forms of violence were 4117, or 3·5 per cent. of all the deaths; in the corresponding three months of 1871 the violent deaths were 4048, or 3·0 per cent. of the deaths from all causes. In workhouses, hospitals, and lunatic asylums 10,136 or 8·6 per cent. of the total deaths were recorded; the proportion in the corresponding quarters of 1870 and 1871 was 8·4 and 8·6 per cent. respectively.

*Health of London and other large Cities in 1872.**

THE Great Cities of the world are every year growing greater. Vienna and Berlin have increased rapidly. Paris, for reasons too obvious and deplorable, has remained nearly stationary since the war; but the population amounted at the last Census to 1,851,792, and the capital of France is, after violation by a mob in the face of her enemies and of her own citizens, still the Queen of continental cities. Rome is to be no longer a city of ruins for poets to sigh over, but the living capital of the Italian nation, in sisterly union with Florence, Naples, Turin, Milan, and Venice. In no land, however, are the cities greater than in the English Empire. The cities of India are flourishing. The United States are emulating the land of their origin. But England maintains its ascendancy; and her capital is the greatest the world ever saw. Babylon, Thebes, Rome were never so populous as London, which has now within its widest boundary upwards of *four million* souls; and had in the middle of 1872, within the limits of the Weekly Tables, 3,311,298.

It is evident that the population of its capital must bear some proportion to the population of the empire, and to the population of the States with which it is in relation. Thus the population of Berlin exceeds the population of St. Petersburg; for though Russia covers a larger area, and has more people than Germany, they are in less intimate relation. And Paris is more populous than the German cities because it has long been the capital of a united nation, in intimate connection with its provinces and with the surrounding States of Europe. While London is the metropolis of a great Empire, with which, as well as with the other States of Europe, America, and Asia, it is kept in intimate connection by means of the mercantile marine, the navy, and the telegraphs. It is the treasury of the wealth and of the mind of a large portion of the world.

Cities are the radiating centres of civilization. And in English cities many economical as well as social advantages are enjoyed; these advantages, too, have undergone no diminution in recent years, otherwise the increase could not have gone on, without their inhabitants exhibiting signs of deterioration, of which no trace exists in the returns. But there is a limit to the growth of every city, as there is a limit to the growth of organic forms; though the extension is neither so definite in space nor in time as it is in species, inasmuch as the growth of cities depends upon the multiplication of coexisting or successive individuals, subject to death indeed, but endowed with surplus powers of reproduction. Some of the canons of the law of limitation are self-evident: a city, for instance, is limited by its water-supply, by its supply of food, by its supply of fuel, by its security from enemies within or without, by its powers of purchasing various requirements, by the attractions it offers in competition with the attractions of other places, and the prices at which these attractions can be purchased. London, in the midst of other centres, attracts and repels various kinds of population in various degrees, and its resident population at a given moment is the result of the equilibrium established at that moment between the various conflicting forces.

The estimated increase of population in the year 1872 was 44,839; and the registered births exceeded the deaths by 46,307 in Registration London.

One cause of the limitation of cities in past ages obtained less attention than it deserves; it is the necessity of removing the daily waste to the atmosphere outside, to the soil or to the sea. The smoke of fires, the dust of workshops, the breath of living things, and all their excretions, are noxious in various degrees. London, with impure wells and without

* Reprinted from the "Annual Summary" for 1872.

sewers, was a city of plagues up to the seventeenth century, and was called in the eighteenth century one of the graves of the nation. The removal of impurities is now carried out to some extent, with the best effect; but difficulties increase, and new engineering agencies have to be brought into the field. The demand, in truth, for new methods of saving and invigorating life is as urgent as the demand for new implements of human destruction.

There is, physically, a limit to the number of people that can live on a given space; in crowds they are in each other's way, and in crowded homes poison each other. The limit varies. London, unlike Venice, has no practical limit of area. As far as houses are concerned, by adopting the system of vertical superposition in stories, so prevalent in the continent and even in some towns of Scotland, the cubical dwelling space on the same area may be augmented; but happily that system has not hitherto prevailed in England. Lofty houses, throwing dark, damp shadows on the streets, each with a common staircase, by which impurities are distributed to many families, however grand to look at, can scarcely fail to be unhealthy to live in.

The population in England is less than one person to an acre of ground; in twenty of the great towns of the United Kingdom the population to an acre is 29, in London within the limits of the Weekly Tables it is 42. But the population is very unevenly distributed over the London area of 78,080 acres: for while, in the large Districts, the persons to an acre are in Lewisham, for instance, 5, in Woolwich 10, Wandsworth 11, the proportions run up to 200 in Holborn, 219 in St. Giles, and 237 in Westminster. In some of the sub-districts the density of population is still greater: in Berwick-street Westminster (St. James), in St. Andrew Eastern, and Whitecross-street Holborn, there are 429, 410, and 418 persons to an acre. 150 persons to an acre in London is, however, a limit beyond which the density of population has not been extending during the last ten years; and in denser districts there has been a tendency of the population to decrease.

The population has decreased in St. George Hanover Square, in Westminster (St. James), and in Marylebone—in all the central districts about the City, in Holborn, the Strand, and St. Giles—in Shoreditch, Whitechapel, and St. George-in-the-East: where the density, if we exclude the river area and the Parks, exceeds the above standard of density.

That the London area is not yet covered is evident from the fact, that if the whole area except the river had a uniform density of 150 persons to an acre, the population would amount to 11,304,300. That such a limit will ever be touched is not probable, as the difficulties of healthy habitation increase with the numbers. Such difficulties are for a time evaded by the residence of householders in the suburbs during the night, and of their families there during day and night. But as the outlying districts, with a few exceptions, although supplied with water, remain imperfectly provided with sewers, or with any other effectual means of removing impurities, this state of things cannot continue without danger, with a population outside the sewerage area running up to a million. Unless the London municipal area be promptly extended so as to include the whole of this outer population, the evils will accumulate to an extent with difficulty reparable.

The worst consequences were apprehended from the increase of London in the reigns of Elizabeth and James I., and an attempt was made to prevent the growth of the capital; but it was in vain, and London grew to its present dimensions in spite of all discouragements, and in spite of the exclusion of nearly the whole of its population from the advantages of municipal institutions: the State ever of old playing the part of a mother that neglects and starves the first born of her children; taking no

pride in its beauty or its growth, but, as if it were not her own, or were her rival, expending her affection on alien objects. Those architectural triumphs, the Tower of London and St. James's Palace, were, exclusive of Westminster Hall, the chief State buildings of the capital until Somerset House was erected. Indeed, London owed its chief ornaments to the Church until quite recently; when a few years of restricted powers of self-government have already given the Metropolis, in addition to its bridges, the grand Thames Embankment, and a vast system of trunk sewers, which, to be complete for the purposes of salubrity, only have to be supplemented by effective branches in communication with every house. The Houses of Parliament, the new Government Offices, the new Courts of Law, and the new Post Office, promise better things; but will London ever rival Athens or Rome in its architecture? Will it find its Pericles?

It is a well-established law that, other things being equal, the insalubrity of a place increases with the density of its population; and that the fevers generated in crowded dwellings have a tendency to spread among the whole of the population. The State, therefore, while it has no right to prevent people in any numbers settling in or near London, has a right to prescribe such conditions of residence as are required in the interests of Public Health.

What is at the present hour especially wanted is the breaking down of the restricted barriers of London, and the extension of municipal organization to the well-considered boundaries laid down in Sir Robert Peel's Metropolitan Police Act, which seems to have taken the prospective increase of population into account: any narrower boundary, while the population is increasing within the great circle at the rate of 75,000 annually, could only be temporary, whereas it is desirable to make the change once for all, or for at least the next hundred years. And it is evident that within this limit the water supply, the drainage, the lighting, the house regulations, and all other municipal regulations, should be under the supreme control of one Municipality, with a great administrator at its head.

The state of things now is, that a small population on 668 acres in the centre, enjoys under a Lord Mayor the old municipal form of government; that 3,266,987 persons on 78,208 acres are living under the Local Management Act, with a paid chairman; and that outside this region 618,654 people, increasing rapidly every day in numbers, are spread over 366,097 acres of land, without sewers, except in a few places, but covered by the Metropolitan Police administration.

If the whole of the people amounting in 1871 to 3,885,641 on a circle with a radius of 15 miles can be administered for police purposes from Scotland Yard, can they not be associated together in one community for the purposes of local government, with the City for the central point of its administration? A city is a Co-operative Society for the supply of common wants; and as the police now discharges the duties of defence which were formerly left to householders, and to parish constables; as common sewers carry away impurities which were formerly got rid of by each householder; so water, light, and perhaps heat, and force to a certain extent, may be provided by a sound municipal organization; in fact, almost every commodity in universal demand which can either only be supplied under monopolies, or be supplied imperfectly under competition. Under this head naturally fall the conditions of healthy existence.

THE GREATEST LONDON*; OR THE METROPOLITAN POLICE DISTRICT.

In this London on the Thames, including all the parishes partly or wholly within a circle of 15 miles (= 14.9 miles) round Charing Cross,

* For population of London within its several boundaries see Census of England and Wales, 1871, Vol. ii. p. 38.

the mean density of population in 1872 was 9 to an acre; and the annual rate of mortality was 20·8 per 1000. In the 10 years 1861-70 the annual rate was 23·6, in 1871 it was 23·7. The outer ring includes 11 entire districts, with parts of 5 districts; or 44 entire sub-districts; where the mean density of population is expressed by 1·8 persons to an acre, and the mortality was at the rate of 17·5 in 1872, against 19·3 in the 10 years 1861-70, and 19·0 in 1871.

The mortality of the Registration London, at the rate of 24·3 per 1000 during the 10 years, was one-fourth part higher than the mortality in the outer ring; the difference in the annual deaths was 5 deaths in 1000 living. In 1872 the advantages remained in favour of the outside districts, where the population has more air to live in, but the difference in the two rates declined from 5 to 4 in 1000. This is shown in the annexed table:—

ANNUAL RATES OF MORTALITY per 1000.

	Ten Years 1861-70.	1871.	1872.
In the Metropolitan and City Police Districts -	23·6	23·7	20·8
In Registration London - - - -	24·8	24·6	21·5
Outside Registration London - - -	19·3	19·0	17·5

The rates of mortality in the several Districts varied from 15 to 29 per 1000 for the ten years 1861-70, so far as the mortality can be now determined. The deaths in the large hospitals being omitted, the mortality in the other Districts is somewhat understated.

DISTRICTS and SUB-DISTRICTS within the METROPOLITAN and CITY POLICE DISTRICT, arranged in the ORDER of MORTALITY from the lowest to the highest.

(The Districts containing the large Hospitals and Lunatic Asylums are excluded, also Four Sub-districts for other reasons.)

AVERAGE ANNUAL DEATH-RATE per 1000 in the 10 years 1861-1870.

		17. St. Geo. in the East 28·6

Note.—The Districts numbered up to 28 inclusive are in Registration London; the rest are in the Outer Ring.

THE LONDON OF THE WEEKLY TABLES, 1872.

In this year of mild temperature, and great rain-fall, the mortality, which was 21 on an average, varied from week to week: represented by a curve, the mortality had two maxima (26) in the cold second week of January, (27) in the hot first week of August; and two minima, the first (17) in the last week of June, and the second (17) in the third week of September.

Thus the winter and summer diseases prevail most, respectively in the coldest and hottest weather; and then their decline reduces the mortality to a minimum. This law prevailed in the whole of the town popula-

tions, but with considerable variation in particular towns: the highest weekly mortality was met with in Wolverhampton, where in the first three weeks of the year the rates were 59, 49, 47: while some of the lowest weekly rates (14 and 15) prevailed in that town and in Bristol.

Diarrhoea was the prevalent fatal zymotic disease in London, and raised the summer mortality; whooping-cough 3249, small-pox 1781, measles 1680, and fever 1340, were the other most fatal diseases of the same class. The great number of 2608 deaths by violence is remarkable; 2169 having been referred to negligence or accident, 125 to homicide, 268 to suicide, and one to execution. 81 suicides were committed by wounds, 17 of them gunshot; 64 by hanging, 44 by poison, and 57 by drowning, and 22 by other means. The suicides by drowning are probably understated; for the "found drowned" are classed under accident, unless the coroners discovered the cause of the drowning. Efforts should be made to diminish these violent deaths, especially those from vehicles without proper drags, driven in the streets by incompetent drivers. Deaths by burning have happily declined; but 239 deaths by this dreadful cause are still too numerous. Numbers may be rescued as "brands from the burning" by more attention to dress, by fire-guards, and safety ladders. The deaths by burns in the summer quarter, 30, it will be noticed are less than half as many as the deaths in the Christmas quarter following, when more fires are burning.

The Weekly Returns of the number of deaths by fevers in 33 years show what may be the influence of the seasons on these formidable diseases. The influence is not great; the weekly mean number of deaths by fever is 43; and it ranged from 38 in the middle of the year, or the end of June, to 49 and 50 in December. Fever-matter (*typhine*) has an independent life of its own, undergoing periodical developments; thus, while the disease in the middle of 1845 was fatal to 14, 18, and 18 in three successive weeks of July, it rose in 1846, and in three weeks of December 1847 was fatal to 132, 136, and 131 lives in successive weeks: the disease was again epidemic in 1864; while at the end of 1872 it had fallen to a low ebb.

Recent research has shown that the common continued fevers of England may be resolved into three kinds, *typhus*; enteric or typhoid fever (*typhia*); and relapsing fever (*typhinia*). In the early years the species were not distinguished, and even now they are often confounded by common observers; but in 1872 the deaths returned were by *typhus* 175, *typhia* 824, and simple continued fever 341, including probably a few cases of *typhinia*. Typhus has declined rapidly since 1869, enteric fever (*typhia*) slowly.

12,029 deaths occurred in the public institutions of London; 6177 in the workhouses, 5085 in the civil hospitals, including 94 in hospitals for foreigners; 183 men died in the naval and military hospitals; 16 women and 60 children died in lying-in hospitals, 191 men and 155 women in lunatic asylums. One person in 6 dies in a public institution. Out of 100 deaths 9 occurred in workhouses, 8 in hospitals. The deaths in public institutions are increasing; more dying in hospitals, fewer in workhouses and prisons.

London within the Tables can now be followed through the 33 years 1840-1872; and by means of the Censuses and the death-returns its annual rates of mortality are shown in its five great divisions. The mortality during the whole period is at the rate of 24.3 per 1000; in the West Districts 22.7; in the North Districts 22.9; in the South Districts 24.5; in the Central Districts 25.2; in the East Districts 26.0. The mortality in the five corresponding groups of Districts in 1872 was at the rate of, West 19.6; North 21.2; South 20.9; Central 23.6; East 23.6. The density of population in the five groups, expressed in persons to an acre, was West 52, North 56, South 21, Central 150, and East 107.

This Table (No. 37) is the test of the result of sanitary improvements; and it is gratifying to find, that while the population has gone on increasing, and has grown denser in the parts formerly open, the mortality, on the whole, has not increased; on the contrary, it has decreased; for if, to get rid of fluctuations, we compare the mortality of 184c-9 with that of 1860-9, there is a decrease from 25.2 to 24.3 in the rate, or nearly of 1 per 1000. Taking the five regions, this improvement is found in the West; in the North and the East there is a slight deterioration; in the dense Central region the mortality increased; while in South London the mortality fell from 26.6 to 23.2, or 3.4 in the 20 years of interval. This is decisive evidence of the salutary effects of the drainage of South London, which was formerly a marsh; and of the substitution of a better water for the impure waters drawn from the Thames, at points where its stream was polluted by London sewage. The decisive improvement of South London, it will be seen in the Table, became manifest in 1856.

Some disappointment may be felt that the mortality of London, which should be below 20, has not descended permanently to that rate: the reason is too obvious, for the water supply is still drawn from the stream of the upper Thames, which drains a populous basin, and receives much of its impurities. Then it has been shown that although the main sewers have been well laid, the branch sewers, under the district boards, are still imperfect; they are in places ponds of impurities, as Dr. Hardwick and others have discovered by inspection, even in the West End of London. Fine old houses have had vast cesspools laid in the præcloacal age; and those cesspools in many cases remain undisturbed, exhaling their fumes through the air. The London Building Act, in some respects worse than the Sanitary Acts applying to country districts, has no adequate clauses to provide for the effectual purity of the new dwellings erected. There is still a want of thoroughness in the London sanitary work, accounting fully for the higher rates of mortality, which look unfavourable by the side of a high standard of salubrity, but favourable as compared with the rates of other cities left in a worse state.

In the year 1872 the annual rate of mortality fell to 21.5 per 1000: this contrasts favourably not only with 1849 and 1854, when the annual rates were, owing to cholera, 30.1 and 29.4, but with every year except 1850, after the cholera had swept off the feeble, when the rate was 21.0. The causes of this better state of things can be most conveniently discussed in the Annual Report, for they were in general operation throughout the kingdom.

In the meantime, London may accept the improvement in the vitality of her population as of good augury.

THE 20 GREAT CITIES AND TOWNS.

Their mortality in the aggregate is above the London standard; they lag, as might be expected, somewhat behind the capital, and their mortality only fell in 1872 to 24.3, which was the rate in London during the twelve years 1860-71. These 20 cities are arranged below in the order of their mortality during the last five years. It is right to bear in mind that the three cities of highest mortality are the densest. Density raises the mortality through the condensation of impurity; the quantity of air respired being equal in two populations, the quantity of impurity taken in bears a certain proportion to the strength of the noxious mixture. While density of population does not, therefore, necessarily, it does practically imply density of zymotic impurity in most towns; and a higher resulting rate of mortality. Precautions are required in proportion to density in order to obviate its evils.

20 GREAT CITIES and TOWNS of the KINGDOM arranged in the ORDER of MORTALITY.

AVERAGE ANNUAL DEATH-RATE per 1000, 1868-1872.			
Portsmouth - 21·9	Hull - 25·4	Sunderland - 26·8	Newcastle-on-Tyne 27·6
Bristol - 23·8	Edinburgh - 26·0	Oldham - 27·0	Salford - 27·9
Birmingham - 24·0	Dublin - 26·0	Leicester - 27·3	Manchester - 30·9
Nottingham - 24·9	Bradford - 26·4	Sheffield - 27·5	Glasgow - 31·1
Norwich - 25·2	Wolverhampton 26·5	Leeds - 27·6	Liverpool - 31·3

The Authorities of the 20 great cities deserve applause for what they have done or attempted; but they are far from having attained the stage of the traveller who can rest and be thankful. The deaths in 1872 were in excess by 53,886—more than 1000 a week—of the healthy standard; at the rate of 17 to 1000 inhabitants, the deaths would have been 125,682; whereas 179,568 deaths were registered in the year: and so long as the wails of thousands of children, of the young cut off in the bloom of life, of fathers dying of fever or killed outright by violence, of mothers perishing in childbirth, of men who never attain the fulness of age, are heard, mayors and town councillors should give themselves no rest until they have done their utmost by sanitary precautions to save life, and to render the respective populations under their rule vigorous. They are now on their trial. They will be questioned at the bar of public opinion. They are about to appoint health officers; will they carry out their recommendations, backed as they are by the experience of the navy and army, as well as by the whole series of national civil returns, showing how invariably sweet air, pure water, cleanliness, and hygienic measures of every kind, are attended by health and strength, and their absence by death, disease, and disability?

THE 50 LARGE TOWN DISTRICTS.

The mortality of these town districts, 24·8 in the year 1871, was at the rate of 23·8 in 1872; higher, in the aggregate, than the mortality of London, but somewhat lower than the mortality of the great cities. They follow arranged in groups according to the order of mortality:—

ANNUAL RATE of MORTALITY per 1,000 Persons estimated to be LIVING during 1872 in 50 LARGE ENGLISH TOWNS; ranged in the order of the rates from the lowest to the highest.

Cheltenham 17·6	Birkenhead - 20·5	Plymouth - 22·3	Carlisle - 24·6	Wigan - 26·6
Hastings - 17·8	Derby - 20·5	Lincoln - 22·4	Stoke-up-Trent 24·8	Macclesfield - 26·6
Maidstone - 18·0	Shrewsbury 20·6	Cardiff - 22·5	Dover - 25·2	Ashton-un-Lyne 26·6
Chatham - 18·8	Brighton - 20·9	Bath - 22·7	Blackburn - 25·5	Merthyr Tydfil - 26·7
Reading - 19·2	Chester - 21·0	Yarmouth - 22·7	Stockport - 25·8	Exeter - 26·8
Oxford - 19·3	Swansea - 21·3	Halifax - 22·9	Gateshead - 25·9	Preston - 27·9
Colchester - 19·3	Worcester - 21·4	Newport(Mon.) 23·0	Bury - 26·3	Walsall - 28·9
Southampton 20·3	Coventry - 21·8	Rochdale - 23·4	EastStonehouse 26·3	Northampton - 29·7
Devonport - 20·4	Gosport - 21·8	Ipswich - 24·0	South Shields - 26·4	Bolton - 30·0
Cambridge - 20·4	Huddersfield 22·2	York - 24·2	Tynemouth - 26·4	Dudley - 32·3

Preston, Walsall, Northampton, Bolton, and Dudley enjoy here a painful pre-eminence, which cannot fail to awaken the attention of their respective authorities.

THE 11 GREAT FOREIGN CITIES.

Health is of almost equal importance to all mankind, and efforts have been made here to induce the authorities of the great cities of the world to record observations as in London on their state as shown by the returns of deaths and fatal diseases compared with the population living. These efforts have been successful in the Capital cities of all the great

Powers except Russia, whence returns are expected shortly from both St. Petersburg and Moscow, which have excellent municipal organizations.

New York sends returns quite regularly. The authorities of Bombay, Madras, and Calcutta deserve great credit for the efforts they are making to compete in the race of improvement with the advanced cities of Europe.

POPULATION, DEATHS, and the DEATH-RATE in 11 FOREIGN CITIES, 1872.

NAME.	POPULATION.	DEATHS.	DEATH-RATE.
PARIS - - -	1,851,792 (1872)	40,479	21·9
BRUSSELS - - -	185,000 (estim ^d)	4,176	22·6

CALCUTTA - - -	477,600 (1872)	11,947	25·0

REMARKS ON the METEOROLOGY of 1872. By JAMES GLAISHER, Esq.,
F.R.S., &c.

The year 1872 was remarkable:—1st for the extraordinary atmospheric depression in the month of January, and the long continued period of depression in the last four months of the year; 2ndly for the lengthened period of warm weather which characterised the first three months of the year, and 3rdly for the remarkable excess of rain-fall during the last quarter of the year.

In Table 40 (pages xcvi and xcvi) the annual means of the several elements for the stations between Guernsey and North Shields are given.

The following remarks with regard to excess or deficiency of atmospheric pressure, temperature, and rain-fall are primarily derived from the observations at the Royal Observatory, but they may be taken as applying generally to the whole country.

Atmospheric pressure.—The reading of the barometer decreased from 29·9 in. on the 1st of January to 28·87 in. by the morning of the 5th, and the mean reading for the 5th was no less than eight tenths of an inch below the average for the day. From the 6th to the 13th the changes were numerous, but on the 14th an increase to 29·9 in. occurred, followed by a steady decrease to 28·9 in. by the 18th. With slight exceptions the mean readings were below their average values from this day until the 3rd of April, and on some days the departures were large especially on the 23rd and 24th of January, when the amounts were 1 in. and 1·1 in. respectively. The minimum value on the 24th of January, viz., 28·21 in. is remarkable as being lower than any since 13th January 1843, when 28·096 in. was recorded. On 24th December 1821 a still lower value was recorded, viz., 27·89 in., and other instances of low readings have been: 6th March 1783, 28·22 in.; 17th December 1809, 28·20 in., and 23rd November 1824, 28·37 in.

On 3rd April, a decided increase set in, and by the 6th 30·3 in. was reached. From the 7th to the 15th high values were generally recorded, but on the 16th a downward tendency was shown which continued until the 21st, when the reading was 28·9 in., the minimum value for the month. From this date with slight exceptions increasing values were recorded to the end of the month.

During the months of May and June the movements were numerous but not generally of very great magnitude, whilst in July the readings were very steady and the range unusually small. In the earlier portion of August larger movements were experienced, the general tendency being to decrease till the 7th when the minimum for the month occurred. After this date increasing values were recorded, the absolute maximum being reached on the 28th. In the last four months of the year the readings were remarkably low, the mean values for each month being respectively 0·13 in., 0·17 in., 0·25 in. and 0·40 in. below the corresponding averages. It is very rarely that so long a period of continuous depression is experienced. The mean value for these months is 29·535 in., and there has been no instance of any approach to such low readings for so lengthened a time except in the year 1841 when the mean for the corresponding period was 29·576 in.

Temperature.—The warm weather which set in on the 13th December 1871, continued with very few and very slight exceptions till the 18th of March 1872. The mean temperature of the 97 days ending on this day was more than 5° in excess as compared with the average, the direction of the wind during this time was mostly from S.W. This warm period of 97 days has, however, been exceeded in length in a few cases. For

instance in 1821 a warm period set in at the end of October and continued until the end of April 1822. In 1833 a warm period began on October 21st, and continued till 16th March 1834. In 1858 a warm period set in on December 18th, and extended to 11th April 1859. In 1862 a warm period commenced at the beginning of December and continued to the end of March 1863. The mean temperature of the five months ending March 1822 was $44^{\circ}6$, for those ending March 1834 was $43^{\circ}5$, and for those ending March 1872 (owing to the severity of the cold in November and December 1871) it was $41^{\circ}3$ only. The mean temperature of four months ending March :—

In the year 1822 was $43^{\circ}8$.	In the year 1863 was $42^{\circ}8$.
" 1834 " $43^{\circ}3$.	" 1872 " $42^{\circ}2$.
" 1859 " $42^{\circ}7$.	

So that, remarkable as the first quarter of the year 1872 had been for its long continued warmth, there were no less than four instances of a more lengthened period, two of which, viz., in the winters of 1821–1822, and 1833–1834 were of nearly five months duration. The mean value for the three months January to March alone was for 1872, $43^{\circ}6$.

The corresponding mean in 1779 was $42^{\circ}4$
" 1819 " $41^{\circ}4$
" 1822 " $43^{\circ}5$
" 1834 " $42^{\circ}9$
" 1846 " $43^{\circ}6$
" 1849 " $41^{\circ}9$
" 1851 " $41^{\circ}9$
" 1859 " $43^{\circ}3$
" 1863 " $42^{\circ}6$

It follows therefore that throughout the period of 100 years the warmth of the first quarter of 1872 has been but once equalled, viz., in 1846, and has never been exceeded, but in two instances there have been closely approximate values, viz., in the year 1822 and 1859. From the end of March until the first week of May the weather was very changeable with alternate periods of warmth and cold of short duration, the warm periods generally preponderating both in duration and amount. From the 6th of May to the 12th of June the weather was generally cold and cloudy. On June 13th a warm period set in, and for some days the weather was fine, bright, and hot, with heavy thunderstorms on June 17th, 18th, and 19th principally over the Northern and Midland Counties. A long period of changeable weather now ensued which continued until the middle of August, the weather then improved somewhat, about the 16th, but became broken towards the end of the month, and was changeable till the end of the first week in September, with very mild, and almost summer like temperature; in the second week the weather was unsettled, particularly in the north, where much rain fell, whilst in the south it was finer with but little rain, and the mean daily excess of temperature for the 33 days ending September 17th was nearly 4° .

From September 18th to October 24th, cold, ungenial weather prevailed, although S.W. and W.S.W. winds predominated, and the average daily deficiency of temperature was about 4° . A warm period set in on the 25th October and continued till November 9th, with an average excess of $3\frac{1}{2}^{\circ}$, and this was followed by a steady cold period from November 10th to 19th with the wind from N. and N.E. and an average deficiency of 5° . On November 20th a period ensued of as warm weather as the preceding period was cold, lasting until December 3rd, after which occurred variable periods until the 19th but generally a deficiency of temperature was more strongly marked, but on the 20th of December a remarkably warm period set in, which continued until the end of the year and yielded an average daily excess of more than 9° .

Rain-fall.—The fall of rain in January was large, being as much as 1·7 in. in excess, but in February less rain than the average fall was measured to the extent of 0·8 in. In March the amount again exceeded its average but only to the amount of 0·5 in., and in the next three months the falls were slightly in defect in April and June, but in excess to almost the same amount in May. In July the amount was nearly the same as its average, in August slightly in excess, but in September as much as 1·0 in. in defect. The rain-fall, however, in these months was much heavier in the Northern than in the Southern counties and harvesting was frequently interrupted both in August and September by heavy rains and frequent thunderstorms, so that by the end of September very little progress had been made either in the north of Ireland or in Scotland, where operations were still further checked by sleet and snow. In the next three months the frequency of rain was a most remarkable feature. During this period it fell on no fewer than 67 days, a larger number than had been previously experienced at Greenwich since the year 1815. The total amount was large, amounting to 11·32 ins., a quantity no less than 4·2 ins. in excess of the average. In 58 years this fall has but once been exceeded in the corresponding three months, viz., in 1821 when it was 11·47 ins. or 0·15 in. greater; and back to 1815 there is only one other year in which a greater quantity than 11 ins. was recorded, viz., in 1852, 11·13 ins.

This unusual frequency of rain was general over the country. At Stonyhurst, rain fell on 89 days, and at Guernsey on 80 days whilst the general average over the country was 67 days. The amount at Guernsey was very remarkable being as much as 25½ ins.

The mean amount from all the stations was 13·97 ins. being more than double the fall in the corresponding period of 1871, which was 6·09 ins.

The total rain-falls for the year ranged from 65·4 ins. at Allenheads, to 28·5 ins. at Royston, and the number of rainy days from 319 at Stonyhurst, to 156 at Holkham.

PRELIMINARY TABLES.

TABLE 1.—Estimated Population, and Number of Marriages, Births, and Deaths registered in England in each of the Thirty-five Years 1838-72.

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of each Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS	EXCESS OF BIRTHS OVER DEATHS.
1838	15,287,699	118,067	236,134	468,787	348,760	120,027
1839	15,514,255	123,168	246,333	498,374	338,984	159,390
1840	15,730,813	123,665	247,330	502,308	359,687	142,621
1841	15,939,492	122,496	244,992	512,168	343,847	168,321
1842	16,120,226	118,825	237,650	517,739	346,519	169,220
1843	16,292,226	122,618	245,236	527,225	348,445	178,780

Mean - -	16·5	32·8	22·2	61	30	45

NOTE.—The Table may be read thus:—In the year 1838 to every 10,000 persons living there were 154 persons married, 308 births, and 234 deaths; the number of persons living to every person married, birth or death, was 65, 33, and 45 respectively. The rates in this Table have been calculated upon the estimated populations given in Table 1, but no corrections have been made for the difference between an ordinary year of 365 days and leap year.

TABLE 3.—Marriages in England in each of the Thirty-two Years 1841-72; those solemnized according to, and not according to, the Rites of the Established Church; with other details respecting the Marriages in the Churches of the Established Church.

1872 -	40,229	50,220	42,218	60,220	14'1	17'5	17'1	20'8
Mean Annual Rate per 1000 in each quarter	-	-	-	-	12'7	16'9	15'9	19'6

Note.—The three months January, February, and March contain 90 days, and in leap year 91 days; the three months April, May, and June 91 days; and each of the last two quarters of the year 92 days. For this inequality a correction has been made in the above calculations.

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living, 124 persons were married.

TABLE 6.—Marriages in England. The Proportion per Cent. of **Minors** of each Sex, of Males and Females who **signed the Register with Marks**, and of Persons who were **Widowers** or **Widows**, in each of the Thirty-two Years 1841-72.

Average proportion in 35 years, 1833-72 - -			23·3	21·4	104	109

The Table may be read thus:—In the year 1833 to every 1000 males living there were 23·4 deaths; to every 1000 females living there were 21·5 deaths; and to each 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of males and females; and that out of equal numbers *living* the deaths of males were as 109 to every 100 deaths of females in 1833.

TABLE 19.—Deaths of 75 Persons returned as Aged 100 Years and upwards in ENGLAND and WALES during the Year 1872.

District Numb.	DISTRICT.	DATE OF DEATH.	PLACE OF DEATH.	SEX.	STATED AGE.	OCCUPATION.	CAUSE OF DEATH.
8	Ilalington	12 Sept.	20, St. James's Road	M.	107	Farmer	Age; bedsores.

Note.—The Table may thus be read :—Of each 1000 male children living under five years of age, 72'5 died in the 35 years 1838-72; in the five years 1841-45 this proportion averaged 69'0 per 1000; and in the five years 1866-70 it was 73'0.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (see Table 61, pp. cxiv-cxv), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

Mean Annual Rate per 1000 in each Quarter					-	24·9	23·1	20·7	21·9

* These rates may thus be read, without reference to the decimal points:—In the March quarter of the year 1838, to 10,000 of the population 263 deaths were registered. A correction has been made in the calculations for the inequality in the number of days in the different quarters, see note to Table 5.

TABLE 27.—Proportional Number of Deaths in England in each Quarter to 1000 Deaths in the Average Quarter* of each of the Thirty-five Years 1838-72.

								Llansamlet (Neath) Sub-dists.

NOTE.—The letter M or P affixed to the name of each Town denotes whether the limits, which the District or Sub-districts in the last column approximately represent, are Municipal or Parliamentary.

* The figures in this column are the unregistered numbers enumerated at the Census in April 1871, raised to the middle of 1872 by the addition of 1/3 times the annual rate of increase which prevailed between 1861 and 1871. A decrease of population between 1861 and 1871 was shown in Gosport, Devonport, Dudley, Coventry, Macclesfield, and Ashton-under-Lyne; in these instances the enumerated population has been proportionally depressed.

† These rates of mortality have been corrected by the exclusion of a proportional number of deaths occurring in County Hospitals and Lunatic Asylums, situate within the District or Sub-districts here taken as representing the town, or by the exclusion or addition of a proportion of the deaths in Union Workhouses in cases where a portion of the Union only is embraced by the area taken, or where the Workhouse is situated outside that area.

TABLE 34.—Population; Births and Deaths; Annual Birth and Death Rates; Mean Temperature and Rainfall, in the Year 1872, in LONDON and TWENTY other LARGE TOWNS of the UNITED KINGDOM.

* The figures in this column, excepting those for London and Dublin, are the uncorrected numbers enumerated at the Census in April 1871, raised to the middle of 1872 by the addition of 1½ times the annual rate of increase which prevailed between 1861 and 1871. The estimate for London is based upon the revised Census number for 1871, and in the case of Dublin the population is taken as stationary at the revised number then enumerated.

Average Number living } to One Death annually } (1840-72) }	41	44	44	40	38	41

NOTE.—The populations upon which these rates of mortality have been calculated are deduced from the numbers enumerated at the four Censuses of 1841, 1861, 1861, and 1871. The deaths used are those registered in the complete years.

Certain alterations affecting the West and Central groups of districts were made in the year 1868, but corrections have not been made in the results given in this Table for years prior to 1861.

1870 - -	10,306,458	21,088,323	13,964,741	45,949,522	12,908 2,426 19 6	
1871 - -	10,673,623	21,860,660	14,479,630	47,968,913	16,517 2,706 7 0	
1872 - -	11,061,216	22,706,307	14,971,368	49,738,992	17,913 2,987 5 6	

NOTE.—The numbers for 1867 were registered in the half year ending 31st December.

TABLE 44.—Area, estimated Population, and Marriages, Births, and Deaths registered in the United Kingdom, in the Year 1872.

—	AREA IN STATUTE ACRES.	AREA IN HECTARES.	Estimated POPULATION in the middle of the Year 1872.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM	77,635,946	31,416,735	31,530,200	263,961	507,923	1,094,073	665,536
Great Britain - -	56,515,354	23,203,526	26,407,051	236,927	453,604	944,780	598,006
England and Wales -	37,319,221	15,102,008	23,067,565	201,907	403,534	826,907	493,265
Scotland - - -	19,496,133	7,869,520	3,339,526	35,020	51,160	118,873	75,741
Ireland * - - -	20,619,588	8,438,207	5,072,199	27,114	54,239	149,383	97,577

* On the authority of the Registrar General of Ireland it may be assumed that the numbers of marriages, births, and deaths, in that part of the United Kingdom are understated through defective registration.

TABLE 45.—Proportion per 1000 of Marriages, Births, and Deaths to the Population of the United Kingdom, in the Year 1872.

—	ACRES TO A PERSON.	HECTARES TO A PERSON.	TO 1000 PERSONS LIVING.			
			MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM - -	2'44	'967	7'86	16'0	34'4	20'9
Great Britain - - -	2'15	'860	8'67	17'1	35'7	21'5
England and Wales - -	1'68	'655	8'73	17'5	35'8	21'3
Scotland - - - - -	5'74	2'331	7'58	15'1	35'0	22'3
Ireland - - - - -	3'86	1'666	5'06	10'1	27'6	18'3

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

TABLE 46.—Population, Area, Births, and Deaths in the Islands in the British Seas in the Twenty-two Years 1851-1872.

* The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 36 in 1856, 50 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 99 in 1861, 122 in 1862, 116 in 1863, 26 in 1864, 140 in 1865, 154 in 1866, 37 in 1867, 21 in 1868, 51 in 1869, 27 in 1870, 24 in 1871, and 1 in 1872. The number is 1,648 in seventeen years, which, if added to the 9,440 above, makes 11,088, the total number of deaths of British subjects at sea in 1856-72, exclusive of those of merchant seamen. The Entries in the "Marine Register" of Births occurring in 1872 were but 78, and of Deaths 213.

In the 21 years 1852-72	3,844,245	31,415	21·2

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen. Since 1867 the return includes seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a seaman die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a passenger die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

TABLE 60.—RETURN OF THE AGES, RATING, and CAUSES OF DEATHS OF 4,123 Seamen reported to the BOARD OF TRADE as having died in the British Merchant Service in the Year 1872. (*Parliamentary Returns, No. 216, Session of 1873.*)

TABLE 62.

ESTIMATED POPULATION OF THE UNITED KINGDOM,
(including ISLANDS in the BRITISH SEAS)
with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of the Census Years.	PERSONS.	MALES.	FEMALES.
1801 -	16,302,410	8,096,082	8,206,328
1811 -	18,532,522	9,194,348	9,338,174
1821 -	21,300,573	10,519,256	10,781,317
1831 -	24,423,588	12,004,025	12,419,563
1841 -	27,077,095	13,325,889	13,751,206
1851 -	27,764,034	13,656,998	14,107,036
1861 -	29,358,927	14,397,427	14,961,500
1871 -	31,914,985	15,622,725	16,292,260

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, the proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

The above numbers have been deduced by adding to the estimated population of the United Kingdom, as given in Table 61, the enumerated population of the Islands in the British Seas, and the Army, Navy, and Merchant Service abroad (see p. vii. of Vol. I. Census of England and Wales, 1871).

NOTE.—Cholera is given as being chiefly the cause of the high rate of mortality in Denmark in 1853; in Sweden in 1853, 1867, and 1868; in Austria in 1868; in Prussia in 1868; in the Netherlands in 1859 and 1866, where also small-pox prevailed in 1871; and in France in 1865 and 1866. War contributed to the same end in Denmark in 1859 and 1864; in Austria in 1866; in Prussia in 1865, 1870, and 1871; and in France in 1870 and 1871.

M. V. Falbe-Hansen remarks that an addition of territory containing about 8000 population was made in 1864, and the facts relating to these are shown in this Table from 1860.

* The populations for these years were enumerated at the respective Censuses.

† Cholera was epidemic in the year 1853, and war raged in the years 1850 and 1864.

NOTE.—Previous to 1st January 1860 children who died within 24 hours after birth were counted as still-born.

TABLE 67.—Sweden. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1850 to 1872.

(Supplied by Dr. Berg, Chief of the Statistical Department of Sweden.)

* The populations for these years were enumerated at the respective Censuses. Dr. Berg attributes the decrease observable in the population in the years 1866 and 1869 to failure of crops and consequent emigration.

† Cholera was epidemic in the years 1853, 1857, and 1866.

TABLE 68.—Austria. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1853 to 1872.

(Furnished by Dr. A. Ficker, the Chief of the Statistical Department of Austria.)

1872	29,727,124	191,277	223,224	626,024	671,226	12.4	29.9	22.4

NOTE.—The Returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; since 1863 the returns exclude these portions of the empire. Until 1864 the States of Italy were included; since 1864, however, they are excluded.

* Dr. Ficker attributed the excessive mortality in the year 1866 to Cholera and the war.

TABLE 69.—Prussia. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1853 to 1872.

NOTE.—The Statistical Department of France favoured the Registrar-General with the returns for the years 1863-61 and for the year 1866. The population in the four years 1862-65 and in the years 1867-69 was estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The estimates for 1870 and 1871 have been supplied by the French Government. The returns since the year 1860 include the three newly annexed departments. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which was their last domicile. The Statistical Bureau revised the Population and the numbers of Marriages, Births, and Deaths for the years 1853-71.

* Cholera was prevalent in 1865-66, and war raged in 1870 and 1871.

1871*	—	—	—	—	—	—	—	—
1872*	—	—	—	—	—	—	—	—

NOTE.—The Population enumerated at the Census of 1860 was 15,673,336. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. This method of estimating the population is sanctioned by the Junta General de Estadística at Madrid. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

* The figures relating to 1871 and 1872 have not yet come to hand.

1872‡	—	—	—	—	—	—	—	—

* The decrease of marriages in 1866 may be attributed to the law which then came into operation removing the civil registration from the parochial authorities to the communes; there had been a marked increase in the previous year resulting from a wish to evade the law about to come into operation. Doubtless many of the marriages solemnised in the churches during 1866 escaped registration.

† The figures for 1870 were supplied by Signora L. Bodio, chief of the Statistical Department in Italy.

‡ The figures relating to 1872 were not received in time for publication.

TABLE 74.—Changes in the Constitution of the Superintendent Registrars' Districts and Registration Sub-districts during the Year 1872.

[The Name of the District is in SMALL CAPITALS, that of the Sub-district in *Italics*. The Figures in Cols. 1. and 4. show the number of the District.]

Superintendent Registrar's DISTRICT and Registrar's <i>Sub-district</i> from which a Transference was made.	Date of Change.	Place and Population (1871) transferred from the District in Column 1 to the District in Column 4.	Superintendent Registrar's DISTRICT and Registrar's <i>Sub-district</i> to which an addition was made.
No Change was made during the Year 1872 in the Constitution of Registration Districts or Sub-districts.			

The following alterations were made in the names of the under-mentioned Sub-districts of ROCHDALE, No. 479:

Castleton Without *renamed* Castleton Further.
 Castleton Within " Castleton Nearer.

* The Registration Counties consist of groups of Superintendent Registrar's Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of Registration Counties

therefore differ more or less from the boundaries of Counties (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department; they do not include space occupied by foreshore or tidal water of rivers and creeks.

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1872.

‡ Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. This column also includes 59 cases of marriage after divorce, viz., 22 divorced

women who married spinsters, 21 bachelors who married divorced women, 4 divorced men who married widows, 9 widowers who married divorced women, and 2 divorced men who married divorced women. For the districts in which these marriages took place, see Table 10, p. lxvii, of Report.

* The Registration Counties consist of groups of Superintendent Registrars' Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which either the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties therefore differ more or less from the boundaries of the Counties (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department; they do not include space occupied by inshore or tidal water of rivers and creeks.

Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1872—continued.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are generally identical with the Poor Law Unions of the same names; they are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by H for Hospital or Infirmary, L for Lunatic Asylum, and w for Workhouse Establishment receiving inmates from other Districts than the one in which it stands; and repetitions of these letters show the number of such Institutions in any District.

† Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

II.—SOUTH EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1872.—DISTRICTS—continued.

Table with columns: DISTRICTS, AREA in Statute Acres., POPULATION, 1871., MARRIAGES, BIRTHS, DEATHS, TOTAL (including Illegitimate Births), BIRTHS (Including Illegitimate Births, Males, Females), DEATHS (Males, Females), and Excess of Births over Deaths. Sections include 2.-KENT (ex-metrop.)-cont., 3.-SUSSEX, 4.-HAMPSHIRE, and 5.-BERKSHIRE.

III.—SOUTH MIDLAND COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1872.—DISTRICTS.

Table with columns: DISTRICTS, AREA in Statute Acres., POPULATION, 1871., MARRIAGES, BIRTHS, DEATHS, TOTAL (including Illegitimate Births), BIRTHS (Including Illegitimate Births, Males, Females), DEATHS (Males, Females), and Excess of Births over Deaths. Section includes 6.—MIDDLESEX (ex-metrop.).

III.—SOUTH MIDLAND COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1872.—DISTRICTS.—continued.

Table with columns for Districts, Area in Statute Acres, Population, 1871, Total (Marriages, Births, Deaths), Births (Including Illegitimate, Illegitimate), and Deaths (Including Illegitimate, Illegitimate). Sub-sections include 7.-HERTFORDSHIRE, 8.-BUCKINGHAMSHIRE, 9.-OXFORDSHIRE, 10.-NORTHAMPTONSH., 11.-HUNTINGDONSHIRE, 12.-BEDFORDSHIRE, and 13.-CAMBRIDGESHIRE.

IV.—EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1872.—DISTRICTS.

Table with columns for Districts, Area in Statute Acres, Population, 1871, Total (Marriages, Births, Deaths), Births (Including Illegitimate, Illegitimate), and Deaths (Including Illegitimate, Illegitimate). Sub-section 14.-ESSEX.

VI.—WEST MIDLAND COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1872.—DISTRICTS.—continued.

* Sub-districts are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; w indicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included; H indicates a Hospital or Infirmary; L a Lunatic Asylum; and repetitions of any of these letters show the number of such Institutions in each Registration Sub-district.

† Wherever the minus sign (-) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1872 are given on pages 90-117.

DEATHS IN PUBLIC INSTITUTIONS,
1872.

THE FOLLOWING PAGES contain the numbers of deaths registered during 1872 in most of the public institutions of England. These figures will afford the means of correcting the mortality of districts and sub-districts where affected by the situation therein of these institutions, through the deaths recorded in them. The following list includes all Workhouses, Hospitals, Infirmaries, and public Lunatic Asylums, while prisons, almshouses, schools, private lunatic asylums and benevolent asylums, are excluded. The list, as settled, includes 1245 institutions; of which 712 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 450 Hospitals or Infirmaries; and 83 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients are also included.

Deaths registered in the principal Public Institutions of England in the Year 1872.

* In St. George's House, an asylum for aged poor, situated in this sub-district, 29 deaths occurred during the year.
 † In this sub-district is also situated Nazareth House, an institution for the aged, infirm, and sick, conducted by the Sisters of Nazareth; 22 deaths occurred therein during the year 1872.
 ‡ Five deaths occurred during the year in the Sussex and Brandenburgh private Lunatic Asylum situated in this sub-district.
 § Eleven deaths occurred during the year in the Northumberland House private Lunatic Asylum situated in this sub-district.
 ¶ In the Infant Home, Great Cornam Street, 16 deaths occurred during the year. †† This Workhouse was closed on 23rd March 1872.
 ** In-patients were not received at this building after the opening of the new Hospital in June 1872; see Haggerston East sub-district.

Deaths registered in the principal Public Institutions of England in the Year 1872—continued.

* Seven deaths occurred during the year in the Brislington House private lunatic asylum.

† This hospital is situated partly in Somersetshire and partly in Gloucestershire. As an institution it is counted as belonging to the latter county, in which the larger portion stands; the deaths, however, are referred to the county in which they actually occurred.

‡ Four deaths were registered during the year in the Longwood House private lunatic asylum.

§ Four deaths occurred during the year in the Barnwood House (private) Hospital for the Insane.

Deaths registered in the principal Public Institutions of England in the Year 1872—continued.

NOTE.—The Table may be read thus: Of the 255,135 deaths of Males, 65,587 were those of children under 1 year of age; 20,105 those of the age 1 and under 2 years; 9,650 of the age 3 and under 10 years; 6,642 of the age 15 and under 20 years, and so on.
 * This column includes the deaths of 24 males registered as aged 100 years and upwards; namely, 9 aged 100, 3 aged 101, 2 aged 102, 4 aged 103, 1 aged 104, 1 aged 105, 1 aged 107, and 1 aged 111 years. The districts in which these deaths occurred and the cause of death in each case are stated in Table 19, page lxxvi, of Report.
 The Causes of Death in England and in London, in combination with the Ages at Death, are given at pp. 144-159.

III.—SOUTH MIDLAND COUNTIES.—DEATHS at different Ages, 1872—DISTRICTS—continued.

Table for South Midland Counties showing deaths by age group (1 to 75+) for various districts including Oxfordshire, Northamptonshire, Huntingdons, Bedfordshire, and Cambridgesh. Columns include Districts, Total Births, Total Deaths, and specific age categories.

IV.—EASTERN COUNTIES.

Table for Eastern Counties showing deaths by age group (1 to 75+) for various districts including Essex, Suffolk, and Suffolk. Columns include Districts, Total Births, Total Deaths, and specific age categories.

III.—SOUTH MIDLAND COUNTIES.—DEATHS at different Ages, 1872—DISTRICTS—continued.

Table with columns for Districts, Total Burials, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, 5, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, & upwards).

IV.—EASTERN COUNTIES.

Table with columns for Districts, Total Burials, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, 5, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, & upwards).

V.—SOUTH WESTERN COUNTIES.—DEATHS at different Ages, 1872—DISTRICTS—continued.

Table with columns: No., DISTRICTS., TOTAL BIRTHS., TOTAL DEATHS., and AGES AT DEATH. (Under 1 Year, 1, 2, 3, 4, 5, Under 5 Years, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, 95 & upwards.) Rows include districts like 20.-CORNWALL-cont., 21.-SOMERSETSH., etc.

VI.—WEST MIDLAND COUNTIES.

Table with columns: No., DISTRICTS., TOTAL BIRTHS., TOTAL DEATHS., and AGES AT DEATH. (Under 1 Year, 1, 2, 3, 4, 5, Under 5 Years, 5-10, 10-15, 15-20, 20-25, 25-35, 35-45, 45-55, 55-65, 65-75, 75-85, 85-95, 95 & upwards.) Rows include districts like 22.-GLOUCESTERSH., 23.-HEREFORDSH., 24.-SHEEPSHIRE., 25.-STAFFORDSH., etc.

VI.—WEST MIDLAND COUNTIES.—DEATHS at different Ages, 1872.—DISTRICTS—continued.

Table with columns for Districts, Total Burials, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, Under 5 Years, 5-10, 10-15, 15-20, 20-25, 25-30, 30-35, 35-40, 40-45, 45-50, 50-55, 55-60, 60-65, 65-70, 70-75, 75-80, 80+).

VII.—NORTH MIDLAND COUNTIES.

Table with columns for Districts, Total Burials, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, Under 5 Years, 5-10, 10-15, 15-20, 20-25, 25-30, 30-35, 35-40, 40-45, 45-50, 50-55, 55-60, 60-65, 65-70, 70-75, 75-80, 80+).

VIII.—NORTH WESTERN COUNTIES.—DEATHS at different Ages, 1872.—DISTRICTS.

Table with columns for Districts, Total Births, Total Deaths, and Males. Sub-section: 33.—CHESHIRE. Sub-section: 34.—LANCASHIRE.

IX.—YORKSHIRE.

Table with columns for Districts, Total Births, Total Deaths, and Males. Sub-section: 35.—WEST RIDING. Sub-section: 36.—EAST RIDING (WITH YORK).

IX.—YORKSHIRE.—DEATHS at different Ages, 1872—DISTRICTS—continued.

Table for Yorkshire Districts, Males, showing deaths at different ages (Under 1 Year, 1-4, 5-9, 10-14, 15-19, 20-24, 25-29, 30-34, 35-39, 40-44, 45-49, 50-54, 55-59, 60-64, 65-69, 70-74, 75-79, 80-84, 85-89, 90-94, 95-99, 100+).

X.—NORTHERN COUNTIES.

Table for Northern Counties (Durham, Northumberland, Cumberland, Westmorland), showing deaths at different ages for various districts.

XI.—MONMOUTHSHIRE AND WALES.

Table for Monmouthshire and Wales (Monmouthshire, Glamorganshire, South Wales), showing deaths at different ages for various districts.

IX.—YORKSHIRE.—DEATHS at different Ages, 1872.—DISTRICTS—continued.

Table with columns for Districts, Total Births, Total Deaths, and Ages at Death (Under 1 Year, 1, 2, 3, 4, 5, 6-10, 15, 20, 25, 35, 45, 55, 65, 75, 85, 95 & upwards).

X.—NORTHERN COUNTIES.

Table with columns for Districts (e.g., 38.-DURHAM, 39.-NORTHUMBERL., 40.-CUMBERLAND, 41.-WESTMORL.) and columns for Total Births, Total Deaths, and Ages at Death.

XI.—MONMOUTHSHIRE AND WALES.

Table with columns for Districts (e.g., 42.-MONMOUTHSH., 43.-SOUTH WALES, GLAMORGANSHIRE) and columns for Total Births, Total Deaths, and Ages at Death.

XL.—MONMOUTHSHIRE AND WALES.—DEATHS at different Ages, 1872.—DISTRICTS.—cont.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all Diseases are classified in the Tables of Causes of Death, pp. 146-149, under 116 heads; some of these heads, however, include groups of diseases which are very distinct from one another, but which either are fatal to only a few persons, or are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers

(continued at page 152.)

CAUSES OF DEATH at different Periods of Life, in the Year 1872.

would not materially interfere with the calculated proportions. Where it is desired, partial correction, however, can be made by means of the following Supplementary Table, containing the deaths from many distinct diseases, such as chicken-pox, mumps, &c. &c., which in the preceding Tables, have no separate classification, and also many of the deaths from various forms of disease (such as softening of the brain, *neerencephalus*, deaths from which are included under "Brain Disease, &c.") which in some cases are returned under other heads.

Class and Order in the Table of Diseases under which the Cases are entered.	CAUSES OF DEATH.	ALL AGES.	AGES OF FEMALES.

APPENDIX.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by W. FARR, Esq., M.D., F.R.S.

YEAR 1872.

SIR,

DEATH is the inevitable termination of human life, and is physically only one of the changes of the forces that animate the body in its evolution from a living point to final dissolution into its elements. Its causes are not unimportant even when life is protracted to its extreme limit of a hundred years; but their importance is enhanced incalculably by the fact that life is cut short in childhood and manhood by mechanical injuries, by fire, by water, by poison, by famine, by plague; by zymotic, constitutional, local diseases; and by various agents which modern science has shown are under control.

Homicide is the most dreaded cause of death; it is a cause which society in its earliest stages undertook to limit by punishing menslayers, and by stopping the arm of private vengeance. The primary aim of judicial proceedings was the protection of life against criminals; and in England this gave rise to the coroner, whose office consists mainly, Blackstone says, "in inquiring, when any person is slain, or dies suddenly, or in prison, concerning the death," and committing any one found guilty by the inquest for further trial.* The number of inquests held in the year was 25,705, and the verdicts are thus classified in the Judicial Statistics:—

CORONERS' RETURNS OF INQUESTS, 1872.

(See Judicial Statistics, 1872, p. xxii.)

VERDICT.	TOTAL.	Males.	Females.
TOTAL INQUESTS - - -	25,705	18,046	7,659
Murder - - - - -	257	130	127
Manslaughter - - - - -	176	120	56
Justifiable homicide - - - - -	2	1	1
Suicide or self-murder - - - - -	1,455	1,057	398
Accidental death - - - - -	11,435	9,066	2,369
Injuries, causes unknown - - - - -	250	176	74
Found dead - - - - -	3,083	2,088	1,045
Executed - - - - -	11	11	—
Natural death from :			
Excessive drinking - - - - -	379	258	121
Disease aggravated by neglect - - - - -	160	82	78
Want, cold, exposure, &c. - - - - -	238	143	95
Other causes - - - - -	8,259	4,964	3,295

* See Jarvis on Office and Duties of Coroner, 3rd edition; and Baker's Law of Coroner.

The cost of the inquests was 78,535*l.*, or 3*l.* 1*s.* 1*d.* an inquest ; and this is exclusive of the value of the time of the twelve jurymen summoned to each inquest.

It will be observed that the verdict of murder was only returned in 257 cases, of manslaughter in 176; the convictions for murder on trial were 30, and the executions in the year 14.*

The intention of the inquest was to discover crime, with a view to its punishment and prevention ; and in the imperfect state of science at that time "sudden death" was fixed on as a *primâ facie* ground for inquiry. Now it is well known that many spontaneous diseases take away life suddenly ; and that in some of the most atrocious murders by arsenic, by antimony, and by cruelty, death is slow in its approaches. The mere fact that death is sudden is a ground for medical inspection, but not necessarily for an inquest ; and there are many violent deaths of which a medical inspector may ascertain the causes without moving the apparatus of the inquest, there being no more suspicion of crime in such cases than there is in deaths from fever, pleurisy, or consumption.

With the extension the inquest had attained it left the causes of about 466,560 deaths—of 95 per cent. of the total number in the year—unexplored ; yet it is now ascertained that vast numbers of these deaths are referable to negligence ; or to causes which admit of removal by hygienic treatment, and by sanitary regulation. To take one class of causes only found to prevail with the greatest intensity in the dense population of towns,—it can be shown that with the present distribution of population by age, the mortality in many healthy districts is below, and in none above, 17 annual deaths to 1000 living : and at this rate the deaths in England and Wales would have been 392,151 in the year. The actual deaths registered were 492,265. Hence it follows that at least 100,114 deaths were the results of causes not everywhere,—not necessarily in such fatal operation. The mean lifetime of people living in the least unhealthy districts of the kingdom is 49 years ; in all England 41 years ; thus life is abridged by full 8 years. The half of an English generation is cut off before the forty-sixth year is attained ; and we have seen how small a fraction of the loss of life is the result of intentional homicide. After judicial inquiry, only 125 deaths are referred to this head, whereas full 100,000 deaths due to violations of natural laws call for inquiry, with the prospect of success in the discovery of causes still prevailing, which are as fatal as the serpents, wild beasts, and savage criminals of past ages.

The attempt to extend the inquiry into the causes of death was made in London in the sixteenth century, after the College of Physicians was founded by Linacre. The fatal plagues impressed the minds of statesmen, but to one of the companies of the city of London is due the credit of publishing the first weekly bills of mortality. It was not, however, until 1837 that the Inquiry into the cause of death was instituted in every case of death under the Registration Act. Then the Registrar General engaged the medical colleges to afford him their assistance on the ground of its scientific utility, the "Cause of Death" having been inserted in the schedule of the Bill by the House of Lords, and accepted by the House of Commons, after its importance had been urged by no less a body than the British Association. A Certificate Book first issued by the Registrar General in 1845, to legally qualified medical practitioners, a statistical nosology, and a letter to the coroners completed the administrative machinery under which the results of the inquiry into the causes of death are recorded.

Without entering into metaphysical disputes on causation, it is evident, that to be of practical use, the cause of death recorded must be as clearly defined as possible, and that the verdicts of juries should express the exact essential facts, and not vague generalities.

* See note, p. 203.

There were 790 deaths returned simply as by burns, and as the way in which the burns were wrought is not stated, it is not possible to suggest practical remedies. But 16 deaths by burns are referred distinctly to fires, and this implies that some such deaths may be avoided by preventing fires, by extinguishing fires, by fire-escapes, and by other means. Again, 373 deaths by burns are referred to the clothes taking fire, and this at once suggests that such deaths may be diminished in number by caution in approaching open fires, by fire-guards, and by the use of less combustible dresses than those in common use. And this is confirmed by the discovery that females, whose dresses are the most combustible, are burnt to death in greater numbers than males; and that of 152 males so burnt to death 131 were children under ten years of age, when the clothes of boys are often as combustible as those of girls. The old loose verdict of "drowning" without distinction is of little practical avail, but the knowledge of the circumstances at once suggests a variety of preventions. Thus, while it is stated that 242 males and 2 females were drowned when bathing, 68 males and 2 females by falls from ships, 102 males and 5 females by shipwreck, 4 males in skating, 63 males and 6 females by the upsetting of boats, we cannot but regret that 2854 deaths are registered as found drowned, or drowned, without any further particulars available for analysis. The verdict "suicide" points out a criminal act, but it does not display important links in the chain of causation; for to say nothing of controllable passions, there are the seductive temptations offered by instruments of death at hand. Take out of easy reach the cartridge, the razor, the poison; and the number of suicides from these causes declines. The instrument, therefore, as well as the agent is to be recorded under the cause of death. In deaths by wounds the part wounded is of evident importance; for a gun shot, for example, fatal in the heart or the brain, may be of little consequence in other parts of the body: the wound is only directly fatal in some important organ, which should be specified in the return, as the wound in that organ is the final cause of death. The *place* and the exact *time* in which the fatal injury was inflicted should be noted; this is important in such cases as street accidents, where the sufferer is carried away from the spot and dies elsewhere.

In fine, as is shown in the "Observations on the Registration of the Causes of Violent Deaths,"—

"Care should be taken that every return of a violent death answers the three-fold inquiry involved under 'the Cause of Death,' *namely*,—

(1.) What the deceased killed by his own act, or by that of other persons, and in what circumstances?

(2.) What were the means, instruments, or things by which the fatal injury was produced?

(3.) What was the nature of the mortal injury, and what time elapsed before death?

Or the return should have on the face of it an explanation of the omission.

At the same time the statement should be made as concise as it is clear and comprehensive: no vague or unnecessary word should be inserted."

The inquest is a most valuable institution, and under the intelligent coroners of the country we may hope to see henceforward the true causes of the deaths into which they inquire set forth in systematic completeness, as under the Act 6 & 7 Will. 4. c. 89. they have the power to call in a medical expert, and to direct him to perform a post-mortem examination, with or without a chemical analysis. The new Registration Act relies entirely on the jury, instructed by the coroner, for a return of the cause of death whenever an inquest is held.

Hitherto the grant of certificates of the cause of death by the registered medical practitioners of England has been purely voluntary, and the Registrar General has to thank the medical profession for the hearty co-operation he has received from them in the administration of the Act. In the Amendment Act of 1874 (37 & 38 Victoria) the Legislature has inserted the subjoined clauses:

Certificates of Cause of Death.

Regulations
as to certi-
ficates of
cause of
death.

20. With respect to certificates of the cause of death, the following provisions shall have effect :

- (1.) The Registrar General shall from time to time furnish to every registrar printed forms of certificates of cause of death by registered medical practitioners, and every registrar shall furnish such forms gratis to any registered medical practitioner residing or practising in such registrar's sub-district :
- (2.) In case of the death of any person who has been attended during his last illness by a registered medical practitioner, that practitioner shall sign and give to some person required by this Act to give information concerning the death a certificate stating to the best of his knowledge and belief the cause of death, and such person shall, upon giving information concerning the death, or giving notice of the death, deliver that certificate to the registrar, and the cause of death as stated in that certificate shall be entered in the register, together with the name of the certifying medical practitioner :
- (3.) Where an inquest is held on the body of any deceased person a medical certificate of the cause of death need not be given to the registrar, but the certificate of the finding of the jury furnished by the coroner shall be sufficient.

If any person to whom a medical certificate is given by a registered medical practitioner in pursuance of this section fails to deliver that certificate to the registrar, he shall be liable to a penalty not exceeding *forty shillings*.

And under the penalty clause (39) it is enacted that, "Every person who refuses or fails without reasonable excuse to give or send any certificate in accordance with the provisions of the said Acts (Registration Acts, 1836 and 1874) shall be liable to a penalty not exceeding forty shillings for each offence."

Thus under the Amendment Act every registered medical practitioner in England is bound, under penalty for refusal, to give "a certificate stating to the best of his knowledge and belief the cause of death." This will only bring a salutary pressure to bear on the few practitioners who neglect to give such certificates as have hitherto been given freely by their brethren.

Where the persons deceased have not been attended by registered medical practitioners, and there has been no inquest, there is no provision to secure the certification of the cause of death in the Act ; but this defect may be met to some extent, for under clause 44 the Registrar General, with the consent of the Local Government Board, is empowered "to make regulations for prescribing any matters authorised by this Act to be prescribed, and to revoke and alter such regulations."

In England every poor person, unable to pay for medical advice, can obtain the services of a poor law medical officer gratuitously, so that the day may not be distant when nearly every person dying will be attended by a registered medical attendant.

At present a certain number of educated practitioners holding good degrees are not on the register ; and hitherto their certificates have been received by order of the Registrar General, who did not wish to bring any undue pressure to bear on them. But to comply with the new Act it will be desirable for them to register, as only certificates of registered practitioners are recognized under the above clause.

The refusal of certificates from quacks and pretenders will enlighten the public, and distinguish the qualified practitioner from the unqualified.

In several foreign states every dead body is visited by a medical inspector, who inquires into the cause of death, and grants a certificate, without which the burial cannot take place. As a measure of police this has some advantages. But under the Amendment Act the medical attendant is consulted, and is entrusted by the State with the duty of returning the cause of his patient's death ; he performs in death from disease the office which the coroner executes in sudden deaths, or deaths from violence ; and this arrangement, while it is most satisfactory to private families, is less costly, is probably most agreeable to the practitioner, and supplies more authentic information than could be procured from any other source.

Sometimes the medical practitioner falls into the error of the coroners of old, and omits some essential fact in the associated links of the cause of death. It is important to avoid this mistake. For example, measles is often followed by pneumonia, and other *sequela*; now measles is the primary cause of death in such a case, but it is rendered fatal by the super-vention of pneumonia, which is one of its developments. The cause of death is, therefore, properly returned "measles, pneumonia." So when scarlet fever is followed by fatal dropsy the scarlet fever as well as the dropsy is properly returned. By error, death has been by some practitioners ascribed solely to pyæmia, peritonitis, or hæmorrhage, whereas these secondary diseases have sprung from precedent childbirth, which should never be suppressed.

A great variety of names are in use; but for the purposes of the national register, practitioners will do well to adopt the names in the excellent nomenclature of the Committee appointed by the Royal College of Physicians.

As pathology is continually advancing, changes necessarily supervene in what have been called the morbid units; and these changes have to be recognized in the certificates. Embolism, Bright's disease, hypertrophy of heart are now recognized diseases; they were a few years ago masked and returned under some of their prominent symptoms.

It is true that the disease of which a person dies is at times unknown; the medical practitioner has had inadequate means of observation; he may be imperfectly skilled in advanced diagnosis; or the symptoms may be indistinct, complicated, and only explicable by autopsy. In such cases the certified cause is vague; but it does not follow that the whole series of returns subject to such imperfections is useless. If the attainable though imperfect knowledge of disease suffices for the purposes of medical practice, it cannot be worthless for medical statistics.

The mortality of the year 1872 was below the average, and the diminution of activity was apparent in all the five classes of causes except the third.

I.—ZYMOTIC DISEASES.

The mortality from these maladies showed a sensible decline. Small-pox, which had been excessively fatal in the previous year, declined in virulence; but of it no less than 19,094 persons died. The mean annual mortality* to 10,000 in the 20 years, 1850-69, was at the rate of 2·04, whereas it was 10·24 in 1871, and 8·33 in 1872, and this after the most laudable efforts to extend vaccination by legislative enactments. The mortality by measles, scarlet fever, diphtheria, croup, and the various forms of fever was much below the average. Thus scarlet fever and diphtheria, instead of killing 10·46 in 10,000, as they did in the twenty years, were only fatal to 6·15; the fevers, instead of the average 9·18, were fatal to 6·12. Diarrhœa and cholera together were fatal to 10·05, which is as near the twenty-year average as possible. Whooping-cough was more than usually prevalent.

The enthetic order of disease, which is induced by inoculation of morbid virus, became more fatal.

To syphilis, 1831 deaths were referred; the average rate of the twenty years was 0·59, while in this year it rose to 0·80.

The dread disease hydrophobia, which had gone down to a low point, rose again, and was fatal to 39 persons in the year. It can only be reduced by stricter police regulations.

The dietic order of disease exhibits some changes; deaths referable directly to privation became less frequent; but more deaths than the

* Throughout these comments, by *mortality* must be understood the proportion dying in a year to 10,000 living, unless some other basis is mentioned. The average referred to is drawn from the 20 years 1850-69.

average in the 20 years, 1850-69, were referred to the want of breast-milk. The deaths from purpura and scurvy have grown more frequent since 1860 than they were in the previous 10 years. Alcoholism showed evident marks of decline; and we may hope ere long to see still less evidence of the effects of drinking to excess.

The parasitic order presents some changes; thrush declined, and worms and other parasites have been a little less fatal since 1870 than in the ten preceding years.

The mortality by the whole zymotic class was 50·86 on the average, and only 47·73 in the year under review.

The zymotic diseases replace each other; and when one is rooted out it is apt to be replaced by others which ravage the human race indifferently wherever the conditions of healthy life are wanting. They have this property in common with weeds and other forms of life; as one species recedes, another advances. By improving the hygienic conditions in which men live, you fortify them against infection; and further, by isolating the infected, the chances of attack are diminished.

II.—CONSTITUTIONAL DISEASES.

Like zymotic diseases, these diseases, variable in their seat, are characterized by specific products, which are, however, not to the same extent capable of reproducing themselves in other bodies. Thus soft cancer is diffused over the body of its victim, but it is not like small-pox, infectious.

The constitutional diseases were fatal to 86,280 persons. The mortality was 37·68, the average being 43·12. Gout, the first of the diathetic order, is more fatal than it was, as a natural consequence of the increase of luxurious living among larger numbers of people. The decrease of reported deaths by dropsy is probably only apparent; the disease by better diagnosis being referred to the heart or other original source; and so, perhaps, the increase of cancer may be only apparent, as better means now exist of detecting it in internal organs. Be this as it may, the latter dreadful disease is much more commonly referred to in the Returns than it was; the mortality was 3·15 in 1850-9, became 3·87 in the next decenniad, was 4·29 in 1871, and 4·37 in 1872.

The tubercular is far more fatal than the diathetic order. The great central disease phthisis—commonly called consumption—is the most constant, the most fatal of all the diseases of the human race; the mortality by it alone was 22·97. This is a decline on previous rates, for the average was 26·38. But I reserve any further observations on phthisis until I have to notice the deaths ascribed to asthma and bronchitis.

III.—LOCAL DISEASES.

These diseases are pure inflammations and their sequels, giving rise to general disturbance, and producing changes in the tissues of particular organs; or they are functional disorders, such as insanity and neuralgia. Their mortality is increasing, and they were in the year fatal to 86·22 in 10,000; which is less by 4·27 than the mortality in the previous year, but is 2·89 above the average. The deaths by local diseases were 197,429.

The diseases of the nervous, circulating, respiratory, and digestive systems are the most fatal, as they affect central ruling organs on which the life of the individual and of the more remote parts of the organism directly depends.

The fatal diseases of the nervous system were slightly below the average, they amounted to 62,809, including convulsions 25,377, affecting children chiefly; apoplexy and paralysis together, 23,412; the two affections

running very much into each other, and resulting from lesions of the brain and spinal marrow. It is a curious fact that the deaths referred to each of the two diseases are nearly equal in number. Thus, 11,793 died of apoplexy, 11,619 of paralysis; many of the cases of softening and other affections of the brain are distinguished in the supplementary table (p. 150-1.) to which reference should be made in this and similar cases.

Among the uncommon causes of death shaking palsy may be cited, males 36, females 31; ophthalmia, males 14, females 16; otitis, males 45, females 14. One death of a male (55-65), and one of a female (20-25) are ascribed to catalepsy.

27,086 deaths are referred to diseases of the heart and blood-vessels; among them are 643 from aneurism, 603 from pericarditis, the larger proportion of cases specified being hypertrophies. In syncope 922 persons died. By embolism 136, a disease of recent discovery, and by the distressing angina pectoris 350 persons perished. The embolism was most fatal to women, the angina to men.

The diseases of the respiratory organs of all the local diseases are the most fatal; by them 73,393 persons died. 42,752 deaths are ascribed to bronchitis, 20,282 to pneumonia, and while the deaths by pneumonia (inflammation of the lungs), and asthma have decreased, those from bronchitis have increased steadily from 16,499 in the year 1847 to 32,347 in 1860, and to 42,752 in 1872. Here it is necessary to bring phthisis into account. That disease affects the intestines and other viscera, but its most prominent symptoms, the hæmoptyses, and the largest tubercular deposits are in the lungs, and it was often formerly, and is now sometimes confounded with chronic bronchitis. Hence we may inquire whether the increase of bronchitis is only apparent; whether what was formerly called phthisis, or popularly consumption, may not now be called bronchitis. In that case there should have been a corresponding decrease from phthisis, which has, however, not been observed. The deaths ascribed to phthisis (consumption) were 53,317 in 1847; 51,024 in 1860; and 52,589 in 1872. Taking the deaths from pneumonia, bronchitis, and phthisis together for the three years 1847-60-72, the numbers are 93,263, 108,635, and 115,623. The increase of population has to be taken into account, and this is done in calculating the rate of mortality. Now, dealing with the whole order, the mortality by respiratory diseases was at the rate of 30 and 34 in the two decennials 1850-9 and 1860-9, by phthisis 27 and 25; by the two together 57 and 59. Thus there is an evident increase in the mortality by pulmonary disease.

The year 1872 was remarkable for a diminution in the respiratory mortality; which was due to the mild temperature of the winter, for while extreme winter cold long protracted, always increases, mild weather diminishes the mortality of bronchitis.

The breathing of dust, and of any mechanical substances, such as grit, and particles of steel evolved in grinders' or stonemasons' work, is known to produce diseases of the air tubes, called by various names; and it is thus exceedingly probable that the increase of deaths by bronchitis is due to the smoke, dust, dirt, and other matters in the air of towns and workshops where more people every year are doomed to breathe.

The practical inference is, that the most effectual means should be adopted, to purge the air people breathe of all impurities; hence fires should be constructed to burn their smoke, streets should be kept clean, workshops be well ventilated.

Intestinal disease is increased by the heats of summer, probably increasing the activity of disease matter in air and water, or in the organism itself.

The mortality ascribed to diseases of the digestive organs slightly declined, those by diseases of the urinary organs increased, and that notwith-

standing the sensible diminution of the mortality of stone by one of the most brilliant discoveries of surgery.

Since 1860-64 the mortality by the painful disease, ovarian dropsy, has diminished; it was then at the rate of $\cdot 13$, from that it fell to $\cdot 11$ in 1865-9, and to $\cdot 10$, $\cdot 09$, $\cdot 09$ in the three last years. This may be fairly traced to the skill with which surgeons now extirpate the ovaries, the seat of the disease.

Addison's disease was fatal to 28 males, 29 females; the greatest number of deaths amongst males was at the age 35-45, and amongst females at the age 45-55.

The diseases of the integumentary system were fatal in 1311 instances, including 179 from eczema, 48 from pemphigus, 16 from impetigo, 20 from psoriasis, 13 from elephantiasis, 10 from lepra. What a contrast with the state of things when Europe was covered with hospitals for lepers!

IV.—DEVELOPMENTAL DISEASES.

These diseases are incidental to reproduction, growth, nutrition, and decay. They were the assigned causes of 75,287 deaths, and the rate of mortality under them was 32.88. Of the children born before their intra-uterine life was completed, 10,334 died from causes not specified; they were unable to struggle on into maturer life; 571 children died of cyanosis, the heart's formation remaining incomplete. Spina bifida—the vertebræ of the spine remaining incomplete—was fatal to 452 children; or to exactly the same number (452) as died from all other malformations. Among the deaths from these other malformations there were ascribed to cleft palate 61, anus imperforatus 167, both forms occurring in males more frequently than in females.

Teething is one of the first marked steps in development after birth, and by inducing convulsions and other irritative reflex diseases, it is chargeable with a certain number of deaths; the number so charged was 4093.

The second order of this class consists of the diseases incidental to reproduction. 99 deaths were referred to paramenia and disorders of menstruation; and 2403 to childbirth. This is exclusive of 1400 deaths by metria or puerperal fever. The total deaths of childbearing women by childbearing was 3803. These deaths are very deplorable; they require to be watched, as they are from very various causes, some of which are under control. Metria has been frequently induced by collecting many women into the wards of lying-in hospitals; that evil has been to some extent remedied, but it still exists. A very common cause of death is the want of skilled midwives, to which I have before called attention. A mother's life often hangs on some simple act which can be easily performed by a woman who understands the mechanism of delivery; in the absence of the skilful hand to perform that act she dies and carries out of life with her the unborn child. In some cases there is malformation, or displacement; and in others the powers fail despite the efforts of the highest medical skill; the resources of art fail in the great struggle. The day may be looked forward to when less than 49 mothers perish to every 10,000 children born alive. In the year 1872 the proportion was only 46. But this is higher than the 42 in the years 1857 and 1869; lower than the 60, 61, and 58 in the epidemic years 1847-8-9.

A certain number of women in the early stages of pregnancy die of small-pox, scarlet fever, and other diseases; the number so returned is 34.*

* See Table 11, p. 249.

An attack of small-pox, scarlet fever, or enteric fever is almost invariably fatal to a woman in the advanced stages of pregnancy, and is properly referred to those heads in the abstracts ; 233 such deaths were referred to small-pox, 38 to scarlet fever, 33 to enteric fever, 18 to diarrhœa, 10 to rheumatism, and 3 to syphilis. 65 deaths were by pneumonia, and 1 death by intussusception. 131 deaths of pregnant women were ascribed to phthisis, 68 to heart disease, 19 to nephria (Bright's disease).

There is in some cases early in life simple debility, failure of vital force ; in others reversion of the nutritive process, wasting away, atrophy, ending fatally. To this head are referred 29,983 deaths, exclusive of old age.

This wasting away, this debility, occurs naturally in old age, of which 26,900 persons died. The lamp of life was burnt out. Disease itself, as years wear out the body, is shorn of its symptoms which require strength for their manifestation ; and it is probable that some of the deaths ascribed primarily to old age may have been preceded by pneumonia or other latent maladies.

V.—VIOLENT DEATHS.

In many cases death is evidently caused by mechanical force, or by some of its various changes. Thus in the year 46 persons were struck and killed by lightning. The electric force quenched the force of life. The circumstances of each death during the years 1867-72, so far as recorded, are printed in Table 13, pages 250-1, for the facts may probably be turned to account by physicists at some future time, and although man cannot everywhere arrest Jove's lightning, he can avoid the places where it is most apt to strike. The 46 is an extraordinary number of deaths ; the numbers in the five preceding years having been 17, 11, 7, 19, and 28 ; after the year 1869 such deaths rapidly increased.

The deaths by violence of every kind were 17,257, and the mortality by them was 7.54 ; this is slightly below 7.64, the average mortality of twenty years. The mortality gradually rose from 7.42 in the five years 1855-9 to 7.70 and 7.97 in the two quinquennials following. The deaths by violence bear a certain proportion to the quantity of mechanical force in use, unless special precautions are employed to meet new exigencies ; and that force is increasing every year.

It will be borne in mind that the deaths of merchant seamen by *drowning at sea*, which amounted according to the returns to 2297, besides 67 in the Royal Navy, are not included in the above numbers.

The violent deaths are arranged in five orders, according as they are caused indirectly or directly by human agency ; 15,162 deaths in the first order are referred to what has been called accident, but may be more properly called in many cases negligence ; by battle, the deaths in the second order, no deaths have happily in England been caused since registration began ; the deaths by homicide, in the third order, were 387, the deaths by suicide, in the fourth order, were 1,514 ; and the registered deaths in the final fifth order, by execution, were 10.

The mortality under the five orders was 6.62 by accident or negligence, 0 by battle, .17 by homicide, .66 by suicide, and .004 by execution. This classification is based on the verdicts of the coroners juries which are, as has been shown, often reversed subsequently. The homicides, including infanticides, are perhaps overstated, and the suicides are understated, as in cases of doubt the deaths are referred to the first order. The deaths by suicide are stationary, and there is no reason to believe that the apparent is not a real decline of homicide. Assassination is happily not a crime to which the English race is addicted.

Some of the particular circumstances in which homicide and suicide were perpetrated are shown in the tables. Thus of the 237 persons murdered

111 were males, 126 females; 64 males and 66 females were under a month old; 8 more were boys, 15 girls, under 5; 4 were boys, 8 girls, (5—20); leaving 35 adult men and 37 women murdered over the age of 20. As in India more girls than boys were murdered. The returns show, that of the adult men 25, of the women 15, were murdered by wounds and mechanical violence; of the men one was drowned, of the women 2 were suffocated or strangled. It is difficult to draw any inference from the facts as the coroners omitted in their returns to state in 99 cases how the murder was committed; but it would appear that the men in proportion to their number are as often killed by mechanical violence as the women. No murder is ascribed to poisoning.

101 deaths of males and 49 of females are returned as manslaughters; they are all except 27 males and 9 females adults of 20 years of age and upwards. Of the 74 men manslaughtered, 50 were killed by wounds, blows, and other kinds of mechanical violence; of the manslaughters of 40 women, only 21 are referred to the same score. This may perhaps lessen the alarm some people feel at the imaginary increase of wife-murders.

Suicide was committed by 1095 males, 419 females; 6 of the males, 3 of the females, being over 10 and under 15 years of age; 36 of the men, 11 of the women, over 75 years of age.

The mode of suicide was not returned in 48 cases, 33 males, 15 females. Of the men 186 drowned, 438 hanged, 28 strangled themselves; 24 men, 19 women, threw themselves from heights; 217 men, 62 women, cut their throats; 11 men, 4 women, cut or stabbed themselves; 57 men, no women, shot themselves; 72 men, 66 women, poisoned themselves: laudanum, strychnia, prussic acid, and "vermin killers" were the most common poisons.

Among the deaths of the first order, due to negligence or, the true cause not being known, to what is called accident, there are, exclusive of deaths in mines, 1516 from suffocation, and 3004 from drowning. Of the cases of drowning, exclusive of 335 suicides and 8 murders, there were 2519 returned without any further detail; the insignificant word "found" occurring, however, in 1049 instances. Of the other males, 242 were drowned while bathing, 68 by falling from ships and boats into the water, 102 by shipwreck near the coast, so as to be buried ashore, 4 by immersion while skating or sliding, 63 by upset of boats; of the females distinguished, 2 were drowned while bathing, 2 by falling from ships or boats into the water, 5 by shipwreck, 6 by upset of boats.

Of the males dying by suffocation the mode is not returned in the case of 321 males; but 59 were choked by food, &c.; 273 were smothered under the bedclothes, and 155 were overlaid by mother. 19 died by chloroform. Among females suffocated, the mode of death was not stated in 260 cases; 16 were choked by food, &c., 232 were smothered under the bedclothes, and 171 were overlaid. Four women died by chloroform; or only a fifth part of the men who died by it.

The number of deaths by mechanical violence, exclusive of deaths in mines and on railways, was 5843, namely, 4575 of males and 1268 of females. The particulars when returned are given in the table (p. 196—215). It may suffice to state here that 226 were by horses or other animals, and 1239 by conveyances drawn by horses; of the latter cases 1048 were deaths of males and 191 of females.

There are two groups of violent deaths which have been separately distinguished since 1863, the violent deaths in mines, and the violent deaths on railways. These two great branches of industry are carried on under unusual circumstances, and without the utmost vigilance and skill they involve great sacrifices of life.

The mines are of two kinds, the coal mines, and the copper or other metallic mines, each kind involving its peculiar dangers. The danger of the

coal miner arises from gaseous explosions and from falls of coal, stone, and other bodies from the roof. The copper miner is free from the danger of explosion but deprived of the advantages of ventilation, he works in impure, heated air, which induces a peculiar form of lung disease, developed after a certain number of years exposure. Here we have to do only with violent deaths, which are much less common in copper than they are in coal mines.

The mortality by violent deaths in mines and on railways is shown in the two Tables annexed,* at the several ages, as calculated on the population living at those ages.

The second Table shows the mortality by violent deaths in mines as calculated on the respective mining population, and on the general male population of England and Wales.

With regard to the violent deaths of every kind on railways, either of passengers or railway servants, the mortality has been calculated on the whole population living at several periods of life. This may be compared with the loss of life in mines.

We have no means of determining the mean population exposed to risk on railways, but the number of railway male servants of every kind in 1871 was 84,625, including 13,715 engine drivers and stokers, 22,083 railway officers, clerks, station-masters, and 48,827 railway attendants and servants. This is exclusive of 45,070 railway labourers, platelayers, and navvies.

The number of railway journeys in 1872 was 423,000,000, exclusive of journeys by season ticket holders, making perhaps in the aggregate 500,000,000. Taking each journey as of 9·6 miles† and allowing half an hour for its performance, it follows that the average number of passengers exposed to risk through the year does not exceed 30,000. Adding the 30,000 to 84,625 the total number of persons exposed a year to risk, and among whom the deaths on railways may have occurred was 115,000. Now the deaths were 1160, so the annual rate of mortality was 11 in 10,000.

We have no means in the returns of separating the deaths of passengers from the rest, and there is reason to believe that the companies' returns in which this distinction is made are incomplete.

We do not know the mean ages of railway passengers and railway servants in the aggregate, but dividing the deaths at each age by the living at each age in the whole population, then it is seen that the mortality at seven decennial ages over the age of 15 differs little among men: the loss of life by violence on railways is at a rate slightly above 1 in 10,000; it is 1·0 at the age 15-25, 1·2 at the age 25-35.

It will be seen upon comparing the above figures with those made by the companies to the Board of Trade for the corresponding years that the latter were exceedingly defective, and I claim for the returns which have been made in your Reports, the merit of having called public attention to the excessive number of deaths among the railway staff, as the mortality of that meritorious class of men might be greatly reduced.

I have the honour to be,

Sir

Your obedient servant,

WILLIAM FARR.

To
The Registrar General.

* See page 258.

† See the calculation on which this is based in my Letter to the Registrar-General. Appendix to 31st Report, p. 204.

NOTE.—For the cause of death in the 5 years 1858-62, see Table 7 in the Appendix to the Thirty-fourth Annual Report. The causes of death were not abstracted for the 4 years 1845-48.
 * Order 2, comprising Violent Deaths in Battle is inapplicable to the civil population.
 † The number of persons executed in the several years will not necessarily correspond with that in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year are classed in the latter according to the date of conviction, while the numbers in this Table are placed under the years in which the deaths are registered.

in each of the 26 Years 1847-1872.

* From 1847 to 1857, inclusive, premature birth and infantile debility were abstracted under one heading. In order, therefore, to establish something like uniformity in the above Table, the numbers against each of these separate headings have been estimated from the proportions which the numbers under each bore to the sum of the two in subsequent years, when they were

† See note on page 220.

in England in each of the 26 Years 1847-1872.

TABLE 2. (continued.)—Causes of Death registered in England in each of the 18 Years 1855-72. I. 1,000,000 PERSONS LIVING, the DEATHS from each CLASS OF CAUSES, and from each CAUSE.

Table with columns for Class, Causes of Death, and years 1855-1872. It is divided into sections IV and V, with sub-sections like ORDER 5, ORDER 6, ORDER 7, ORDER 8, ORDER 1, ORDER 2, ORDER 3, ORDER 4, ORDER 5, ORDER 6, ORDER 7, ORDER 8, ORDER 9, ORDER 10, ORDER 11, ORDER 12, ORDER 13, ORDER 14, ORDER 15, ORDER 16, ORDER 17, ORDER 18, ORDER 19, ORDER 20, ORDER 21, ORDER 22, ORDER 23, ORDER 24, ORDER 25, ORDER 26, ORDER 27, ORDER 28, ORDER 29, ORDER 30, ORDER 31, ORDER 32, ORDER 33, ORDER 34, ORDER 35, ORDER 36, ORDER 37, ORDER 38, ORDER 39, ORDER 40, ORDER 41, ORDER 42, ORDER 43, ORDER 44, ORDER 45, ORDER 46, ORDER 47, ORDER 48, ORDER 49, ORDER 50, ORDER 51, ORDER 52, ORDER 53, ORDER 54, ORDER 55, ORDER 56, ORDER 57, ORDER 58, ORDER 59, ORDER 60, ORDER 61, ORDER 62, ORDER 63, ORDER 64, ORDER 65, ORDER 66, ORDER 67, ORDER 68, ORDER 69, ORDER 70, ORDER 71, ORDER 72, ORDER 73, ORDER 74, ORDER 75, ORDER 76, ORDER 77, ORDER 78, ORDER 79, ORDER 80, ORDER 81, ORDER 82, ORDER 83, ORDER 84, ORDER 85, ORDER 86, ORDER 87, ORDER 88, ORDER 89, ORDER 90, ORDER 91, ORDER 92, ORDER 93, ORDER 94, ORDER 95, ORDER 96, ORDER 97, ORDER 98, ORDER 99, ORDER 100. Includes a note: 'In the three years 1855-57 Violent Deaths were not distinguished according to Orders.'

* These rates have been estimated from the figures in Table 1, page 234, which are explained in a note. † For the years 1858-72 the deaths of which the cause was not specified have been distributed pro rata over all the causes in the Table.

TABLE 3.—Causes of Death in England in 1872. Proportional Numbers dying from each Class of Causes, and from each Cause.

Class.	CAUSES OF DEATH.	1872		Class.	CAUSES OF DEATH.	1872		Class.	CAUSES OF DEATH.	1872	
		Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.			Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.			Deaths to 1,000,000 Persons living.	Proportional Number in 1,000,000 Deaths.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.]

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted, the districts have been re-numbered consecutively from 1 to 627.*

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 259) and "Index of certain Towns" (page 269).

INDEX OF SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having compound names in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (570; 2) is the 2d Sub-District of the Wigton District, No. 570.]

SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.
A								
Abbey	Bath . . .	317; 3	Ardleigh	Tendring . . .	194; 5	Baschurch	Ellesmere . . .	354; 4

ALPHABETICAL INDEX

TO

REGISTRAR-GENERAL'S THIRTY-FIFTH ANNUAL
REPORT AND APPENDIX.

	PAGES
AGES ; of Persons married in 1872	xi
Mean Age at Marriage	xi
Deaths of Males and Females registered at different Ages in England in each of the Years 1838-72. (Tables 20, 21, pp. lxxxj, lxxxii.)	xviii-xix
Mortality of Males and Females at different Ages in England in the Years 1838-72. (Tables 22-25, pp. lxxxiii-lxxxvi.)	xviii-xix
of 291,014 Persons married in 1872, distinguishing Bachelors, Spinners, Widowers, Widows	26-28
at Death of Males and Females registered in 1872 in Divisions, Counties, and Districts	120-141
at Death of Males and Females in England registered from different Causes, in 1872	144-149
at Death of Males and Females in England registered from different Supplemental Causes, in 1872	150-153
at Death of Males and Females in London registered from different Causes, in 1872	154-159
(See also MARRIAGES, BIRTHS, and DEATHS.)	
ALCOHOLISM. (See INTEMPERANCE and DELIRIUM TREMENS.)	
APPENDIX TABLES	230-253
AREA in Statute Acres of each Division, County, District, and Sub-district	30-84
of the Islands in the British Seas. (Table 46.)	civ
of the sub-districts of London, inclusive and exclusive of Tidal Water. (Table 36.)	xcv
in Acres and Hectares of the United Kingdom. (Table 44.)	ciii
ARMY ; Strength and Mortality of the Army at Home and Abroad. (Tables 50-57, pp. cviii-cx.)	xxii
Average Strength of the British Army at Home in 1872. (Table 50, p. cviii.)	xxii
Average Strength and Proportion per cent. of the British Army at Home and Abroad in each of the Years 1861-72. (Table 51.)	cviii
Mortality of the Army at Home in 1872. (Table 52, p. cviii.)	xxii
Average Strength of the British Army Abroad in each of the Years 1869-72. (Table 53.)	cix
Number of Deaths in the British Army at Home and Abroad, 1869-72. (Table 54.)	cix
Annual Rate of Mortality per 1000 amongst Officers and Men in the Army at Home and Abroad, 1858-72. (Table 55.)	cix
Strength at Home and Abroad in 1861 and 1871, showing the Numbers and Proportion per cent. born in the different parts of the United Kingdom and elsewhere. (Table 56.)	cx
Deaths in Army Abroad of Officers and Men belonging to Great Britain and to England and Wales, 1858-72. (Table 57.)	cx

	PAGES
AUSTRIA; Average Annual Proportion to Population of Persons married, Births, and Deaths, 1853-72	xxviii
Marriage, Birth, and Death Rates compared with those of other European States. (Table 64.)	cxvii
Estimated Population; Number, and Proportion to Population, of Persons married, Births, and Deaths, in each of the Years 1853-72. (Table 68.)	cxix
BERLIN; Population, Deaths, and Death-rate in 1872	lvi
BIRTHS in 1872, exclusive of still-born	xv
that escape Registration	v & xvi
of the two Sexes	xvi
out of Wedlock, proportions in various Counties	xvi-xvii
in quarter ending March 1872	xxx
in quarter ending June „	xxxvi
in quarter ending September „	xl-xli
in quarter ending December „	xlv
registered in England, and excess over Deaths, in each Year, 1838-72. (Table 1.)	lxii
Legitimate and Illegitimate in England in 1842 and in the Years 1845-72, and Proportion of Males to Females. (Table 11.)	lxxii
proportion of Illegitimate Children to every 100 Births in the several Counties of England in each of the Years 1862-72. (Table 12.)	lxxiii
registered in England in each Quarter of the Years 1838-72. (Table 13.)	lxxiv
proportional Number of Births in each Quarter to 1,000 Births in the average Quarter of the Years 1838-72. (Table 14.)	lxxv
in Counties, in 1872. Numbers, Sex, Legitimate and Illegitimate; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 15.)	lxxvi
proportion of Male and Female Children born in the several Counties of England during each of the Years 1862-72. (Table 16.)	lxxvii
in Fifty large Town Districts in 1872. (Table 33.)	xciii
in Twenty-one large Towns of the United Kingdom in 1872. (Table 34.)	xciv
in London in the Years 1859-72, distinguishing Males and Females. (Table 38.)	xcvii
in the United Kingdom in 1872. (Table 44.)	ciii
in the Islands of the British Seas in the Years 1851-72. (Table 46.)	civ
of British Subjects at Sea, in the Years 1856-72. (Table 58.)	cxi
registered in each of the Divisions, Counties, Districts, and Sub-districts in 1872, distinguishing Males and Females and the Illegitimate	30-84
excess of, over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1872	30-84
registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1872	86-89
of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1872	90-93
in Foreign States. (See FOREIGN STATES.)	
Illegitimate. (See ILLEGITIMATE BIRTHS.)	

	PAGES
BIRTH-RATE in England, 1838-42, 1868-72, and in 1872	xv
in England in each of the Years 1838-72. (Table 2.)	lxxiii
in England in each Quarter of the Years 1838-72. (Table 13.)	lxxiv
in Counties in each of the Years 1862-72. (Table 17.)	lxxviii
in Fifty large Town Districts in 1872. (Table 33.)	xciii
in Twenty-one large Towns of the United Kingdom in 1872. (Table 34.)	xciv
in the United Kingdom in 1872. (Table 45.)	ciii
in Foreign States. (See FOREIGN STATES.)	
BOMBAY; Population, Deaths, and Death-rate in 1872	lvi
BRONCHITIS; Mortality from	225
BRUSSELS; Population, Deaths, and Death-rate in 1872	lvi
BURNS AND SCALDS. (See VIOLENT DEATHS.)	
CALCUTTA; Population, Deaths, and Death-rate in 1872	lvi
CAUSES OF DEATH; of Seamen in the British Merchant Service in 1872. (Table 60.)	cxiii
of Males and Females in England, at different Periods of Life, in 1872	144-149
(Supplementary Table) of Males and Females in England, at different Periods of Life, in 1872	150-158
of Males and Females in London at different Periods of Life, in 1872	154-159
of Males and Females in England, and in each of the Divisions and Counties, in 1872	160-183
(from certain zymotic and other Causes) in 1872, in the Divisions, Counties, and Districts of England	184-195
Dr. Farr's Letter to the Registrar General thereon	219-229
desirability of verdicts by Coroners' juries being less vague.	220-221
certificates of, by medical practitioners	222-223
registered in England in each of the Years 1847-72. (Table 1.— App.)	230-235
Mortality from the several Causes in each of the Years 1855-72. (Table 2.—App.)	236-238
proportional Numbers dying from each Cause in 1872. (Table 3. —App.)	239
Rate of Mortality from different Causes during four periods of Five Years, two Decades, and in 1870, 1871, and 1872. (Table 4.—App.)	240-243
in England, in 1872, arranged in the order of their fatality. (Table 5.—App.)	244
CENTENARIANS; deaths of reputed. (Table 19.)	lxxx
CERTIFICATES OF CAUSE OF DEATH	221-223
CHILDBIRTH; excessive number of Deaths from	226
Deaths in 1872, at different Ages, of Women after Childbearing, classed under different Diseases, and neither referred to Child- birth nor to Metria in the Abstracts. (Table 10.—App.)	248
Deaths of Women in 1872 who were returned as pregnant, classed under certain Diseases. (Table 11.—App.)	249
Deaths of Women from Metria and Childbirth in each of the 26 Years, 1847-72, and proportional Deaths of Mothers to Children born alive. (Table 12.—App.)	249

	PAGES
CONSOLS; average price of, 1852 to 1872. (Table 31.)	xci
CONSTITUTIONAL DISEASES	224
CORONERS' RETURNS, 1872	219
DEATHS in 1872	xvii
of the two Sexes at different Ages	xviii-xix
in Public Institutions	xx-xxi
in the British Army at home and abroad	xxii
in the Royal Navy in 1872 and in the Years 1861-65	xxii-xxiii
and State of the Public Health in quarter ending March 1872	xxxii-xxxv
in quarter ending June	xxxvii-xl
in quarter ending Sept.	xli-xliv
in quarter ending Dec.	xlvi-xlviii
in Eleven Foreign Cities	lvi
registered in England in each Year 1838-72. (Table 1.)	lxii
excess of Births over, in each Year 1838-72. (Table 1.)	lxii
of reputed Centenarians. (Table 19.)	lxxx
registered in England at different Ages (Males and Females) in each of the Years 1838-72. (Tables 20, 21.)	lxxxii-lxxxiii
registered in England in each Quarter of the Years 1838-72. (Table 26.)	lxxxvii
proportional Number in each Quarter to 1,000 Deaths in the average Quarter 1838-72. (Table 27.)	lxxxviii
in Fifty large Town Districts in 1872. (Table 33.)	xciii
in Twenty-one large Towns in 1872. (Table 34.)	xciv
in Public Institutions of London in each of the Years 1860-72. (Table 35.)	xciv
in London of Males and Females in each of the Years 1859-72. (Table 38.)	xcvii
and Meteorology in London in each of the Years 1840-72. (Table 39.)	xcvii
in the United Kingdom in 1872. (Table 44.)	'ciii
in the Islands of the British Seas in each of the Years 1851-72. (Table 46.)	civ
in the British Army at home in 1872. (Table 52.)	cviii
in the British Army at home and abroad in each of the Years 1869-72. (Table 54.)	cix
of Officers and Men in the Army abroad belonging to Great Britain and to England and Wales in each of the Years 1858-72. (Table 57.)	cx
of British Subjects at Sea in each of the Years 1856-72. (Table 58.)	cxi
of Merchant Seamen at Sea in each of the Years 1852-72. (Table 59.)	cxii
at different Ages of Merchant Seamen in 1872. (Table 60.)	cxiii
in Denmark, Sweden, Austria, Prussia, The Netherlands, France, Spain, and Italy. (Tables 66-73.)	cxviii-cxxii
registered in each of the Divisions, Counties, Districts, and Sub- districts in 1872 (distinguishing Males and Females)	30-84
excess of Births over, in each of the Divisions, Counties, Districts, and Sub-districts in 1872	30-84
registered in each of the Four Quarters of 1872 (distinguishing Males and Females), in Divisions and Counties	94-97
in 1872 in the principal Public Institutions	100-117
of Males and Females at different Ages in 1872 in Divisions, Counties, and Districts	120-141

DEATHS—continued.

from different Classes of Disease	223-229
from several Causes in 18 of the largest English Towns in 1872. (Table 14.—App.)	252
from Childbirth. (See <i>CHILDBIRTH</i> .)	
from different Causes. (See <i>CAUSES OF DEATH</i> .)	
from Fever. (See <i>FEVER</i> .)	
by Lightning. (See <i>LIGHTNING</i> .)

LONDON :

Printed by GEORGE E. EYRE and WILLIAM SPOTTISWOODE,
Printers to the Queen's most Excellent Majesty.
For Her Majesty's Stationery Office.

ERRATUM.

The following correction should be made in the *Thirty-fourth Annual Report*. On page 248, in the headings of columns 3. and 6. —

*Instead of "to 1,000,000 Deaths from All Causes,"
read "to 1,000,000 Persons living."*

LANE MEDICAL LIBRARY

To avoid fine, this book should be returned on
or before the date last stamped below.
